

**ANNUAL REPORT
COMPREHENSIVE RESEARCH ON RICE**
January 1, 2009 – March 31, 2010

PROJECT TITLE: Cooperative Extension Rice Variety Adaptation and Cultural Practice Research

PROJECT LEADERS:

James E. Hill, Specialist in UCCE, UC Davis

PRINCIPAL UC INVESTIGATORS:

C.M. Canevari, UCCE Farm Advisor, San Joaquin

L.A. Espino, UCCE Farm Advisor, Colusa, Glenn, Yolo

C.A. Greer, UCCE Farm Advisor, Sacramento, Sutter, Placer, Yuba

R.G. Mutters, UCCE Farm Advisor, Butte

R.L. Wennig, Staff Research Associate, UCCE/UC Davis

LEVEL OF 2009 FUNDING: \$122,740

OBJECTIVES AND EXPERIMENTS CONDUCTED BY LOCATION TO ACCOMPLISH OBJECTIVES:

Objective I

To evaluate newly developed cultivars and existing varieties in on-farm trials under grower conditions in cooperation with the Rice Experiment Station for the purpose of new variety development and release: Cultivar trials were conducted by maturity group at different locations in the Sacramento Valley and the San Joaquin Delta. Several experimental cultivars were evaluated at each location within these groups to compare their performance in different environments of the rice-growing region.

Very Early Maturity Group: Three uniform trials for each of the advanced and experimental lines were conducted at each of the following on-farm sites: the Lauppe Ranch (south Sutter County), the Erdman Ranch (District 108, Yolo County), and at the Del Rio Partners Ranch (San Joaquin Delta, San Joaquin County). In addition to the three on-farm sites, two additional tests were conducted at the Rice Experiment Station (RES) in Butte County. The Advanced test at each site included seventeen entries (seven commercial varieties and ten advanced breeding lines) in four replications. The Preliminary tests included 34 entries, 31 preliminary breeding lines and three commercial varieties as checks, in two replications.

Early Maturity Group: Three uniform tests were conducted at each of the following on-farm sites: the Larrabee Ranch (Glenn County), the Dennis Ranch (Colusa County), and the Marler Farms Ranch (District 10, Yuba County). Two additional trials, Advanced and Preliminary,

were conducted at the RES. The Advanced test at each site included eighteen entries (eight commercial varieties and ten advanced breeding lines) in four replications. The Preliminary tests included 36 entries, three commercial and 33 preliminary breeding lines in two replications.

Intermediate and Late Maturity Group: Two uniform tests were conducted at each of the following on-farm sites: the Wiley Ranch (Glenn County) and the Tucker Ranch (Sutter Basin, Sutter County). Two additional tests were conducted at the RES. The Advanced test at each site included thirteen entries (five commercial varieties and eight advanced breeding lines) in four replications. The Preliminary tests consisted of four commercial varieties and eighteen preliminary breeding lines in two replications.

Objective II

Cultural Practices: Rice variety tests were conducted on Twitchell Island in the western Delta as part of a larger project to evaluate rice under flooded culture as a method of preventing organic soil subsidence. Four commercial varieties with the best potential to tolerate cold temperatures (Calmochi-101, M-104, M-202 and M-206) were compared in one acre plots replicated three times. A small plot test similar to the statewide variety trials was conducted with the above four commercial varieties as standards plus S-102 and L-206 with 12 advanced cold tolerant lines. The purpose of the small plot test was to provide the RES breeders with additional information under very cold conditions. .

Objective III

Extension-Based Equipment and Service: A centrally-based equipment pool is maintained by Project RM-2 to provide services for planting, fertilizing, treatment application, and harvesting of rice and to provide professional technical assistance to UC research project leaders engaged in rice.

To provide professional technical assistance to other UC research project leaders, we assisted in approximately 32 trials including the 18 variety tests. Equipment from the UCCE-based pool for planting, fertilizing and harvesting field experiments was used at more than 18 sites at different times during the season. The most heavily used equipment were the combines followed by the Clampco precision fertilizer rig. We also continued with the prescribed maintenance program for the SWECO plot combine and initiated a maintenance program for the new ALMACO combine.

The ALMACO combine was used to harvest the first four Statewide trials, the remainder were harvested with the SWECO. Following repairs, the ALMACO was used to harvest an additional eight trials.

Objective IV

Extension Education: We disseminated research-based information to California rice producers, dryer operators, millers and the general public through two winter grower meetings, a Rice Production Workshop, field demonstrations, personal communication, and through the distribution of one fact sheet (republication of the 2009 Characteristics of Publicly Developed Varieties), the Rice Field Day Program and other printed material. We hosted the Rice Breeders Tour. Progress was made updating the UCCE rice website.

SUMMARY OF 2009 RESEARCH BY OBJECTIVE

Objective I - Rice Variety Evaluation

Eight uniform advanced breeding line trials and eight preliminary breeding line trials were conducted throughout the major rice producing areas of California. The rice breeders at the RES conducted six additional tests, two from each of the three maturity groups. Many of the experimental lines have been tested and screened in previous years and many lines were in advanced stages (2 or more years) of testing. The RES provided the seed for public varieties and experimental cultivars. No proprietary lines were tested.

The following analyses provide single-location yield summaries for the advanced line tests and over-location agronomic performance summaries for each entry in each maturity category. For quick reference, grain yields of selected commercially available varieties tested in very early, early and intermediate-late tests across years and locations are summarized in Tables 6, 12 and 17. An Agronomy Progress Report, to be published later this year, will provide agronomic performance results for all entries in each experiment.

Very Early Maturity Tests (< 90 days to 50% heading at Biggs): Seven commercial varieties and ten advanced breeding lines were compared in four very early advanced tests. Commercial varieties at each location included S-102, CM-101, M-104, M-202, M-206, L-205 and L-206. The preliminary tests included three commercial varieties and 31 preliminary lines evaluated in separate tests at each location.

Grain yields in the advanced tests averaged 8,740 lb/ac at Biggs-RES, 9,470 lb/ac at Sutter, 11,530 lb/ac at Yolo, and 8,130 lb/ac at San Joaquin (Table 1). Over all locations, the three highest yielding entries on average were advanced long grain lines 06Y575, 07Y508, and 08Y1009 (10,710, 10,410, and 9,910 lb/ac respectively). Other top yielding commercial varieties M-206, L-206, M-104, and L-205 ranked fourth, sixth, ninth, and tenth, respectively. Averaged across locations, yields in the preliminary tests ranged from 8,450 to 10,260 lb/ac (Table 1). The average days to 50% heading for varieties in 2009 was seven days less than in 2008. Spring rains had no significant affect on field preparation and allowed the majority of rice acreage to be planted in a timely manner. Moderate daytime and slightly warmer nighttime temperatures were responsible for decreasing the number of days to heading and keeping lodging to a minimum.

Over a 5-year period and across locations, S-102 was the highest yielding variety followed by M-206 at 9,402 lbs/ac and 9,368 lbs/ac respectively (Table 6).

Early Maturity Tests (90-97 days to 50% heading at Biggs): Eight commercial varieties and ten advanced lines were compared in four early advanced tests. The preliminary tests included three commercial varieties and 33 preliminary lines evaluated in separate tests at each location. Commercial varieties at each location were CH-201, CM-101, S-102, M-202, M-203, M-205, M-206, A-201, CT-202, L-205, and L-206.

Yields in the advanced line tests averaged 9,640 lb/ac at the RES; 9,130 lb/ac at Butte, 8,380 lb/ac at Yuba, and 8,730 lb/ac at Colusa, (Table 7). Advanced long grain 08Y1092 was the highest yielding entry (10,170 lb/ac) when averaged over four locations in 2009 (Table 7). Other consistently high yielding entries were 08Y1048, L-206, 06Y513, and M-205, all ranking within the top ten at all locations. The yield of commercial varieties L-206, M-205, L-205, M-208, M-202, and M-206, ranked third, fifth, ninth, tenth, twelfth, and thirteenth over all locations (Table 7). Average days to 50% heading ranged from 81 days at Yuba County to 85 days at the Colusa County site. The commercial standard M-202 headed at 90 days at Yuba and 89 days at Colusa. M-205 was the highest yielding commercial variety (9,245 lb/ac) followed by M-206 (8,817 lb/ac) when averaged over the last 5 years and across locations (Table 12).

Intermediate-Late Maturity Tests (> 97 days to 50% heading at Biggs) - Five commercial varieties and eight advanced lines were compared in three intermediate-late tests. The preliminary tests included four commercial varieties and eighteen preliminary lines evaluated in separate tests at each location. Commercial varieties at each location included CH-201, M-202, M-205, M-402, L-205, L-206, CT-201, and CT-202.

Average yields in the advanced tests were 9,470 lb/ac at the RES, 10,220 lb/ac at Glenn, and 7,920 lb/ac at Sutter (Table 13). The 2009 advanced over location average yield was 90 lb/ac greater than the 2008 season average. The average yields at the RES and Sutter decreased 930 and 620 lb/ac respectively, while increasing 1680 lb/ac at Glenn compared to the 2008 season. L-206 was the highest yielding commercial variety (9,290 lb/ac), ranking seventh over all. M-402 and M-205 were the next highest yielding commercial varieties across locations (Table 13). The stem rot resistant long grain entry 08Y1154 was the highest yielding advanced entry across locations, at 9490 lb/ac. Average days to 50% heading ranged from 90 days at the RES and Sutter to 92 days at the Glenn location. M-402 required the longest time to 50% heading among the commercial varieties at all locations, (average is 104 days).

Averaged over the last 5 years and across locations, M-205 is the highest yielding (9,195 lb/ac) commercial variety (Table 17). M-205 and M-402 produced 106% and 99%, respectively, of the yield of M-202 on average over the last 5 years (Table 17).

Objective II - Cultural Practices

Table 18 shows the results of the large plot variety test on Twitchell Island. The leading variety was Calmochi-101 followed by M-206, M-104 and M-202. Calmochi-101 is well-known as the

most cold tolerant of commercial California varieties and has become the standard by which to measure this trait against other varieties and advanced lines. In the large plot test Calmochi-101 was significantly higher in yield than the all other varieties. Blanking in M-206 and M-104 was estimated at 10-15% and 5-10% respectively, but M-104 also had additional shattering losses estimated at 10-15% due to 15-20 mph wind speeds. M-202, one of the original cold tolerant Calrose type varieties for the Valley Home/Escalon area had blanking levels of 40%, thus accounting for its poor yield performance and clearly demonstrating the issues of cold tolerance with traditional California varieties.

The commercial varieties in the small plot tests were similar in ranking to the large plot test with Calmochi-101 ranking at the top followed by M-206, M-104 and M-202. The other two commercial varieties, S-102 and L-206 were intermediate between M-202 and the top three ranking varieties (Table 19). In the small plot test, there were no significant differences between the top three commercial varieties. However, the CV is unusually large compared to typical small plot variety tests likely as a result of stand establishment problems. Three advanced line cultivars (two medium grains) ranked highest in yield and thus indicate the potential for medium grain Calrose types to yield at the level of Calmochi-101 in cold environments. At Twitchell Island, the average time to 50% heading for these very early varieties was 115 days after planting and fully 10 days later than the average days to heading for intermediate to late maturing varieties in Sacramento Valley tests, again demonstrating the challenges of growing rice in this environment.

Objective III - Assistance to Other Projects

We continued the maintenance program for the UC SWECO plot combine. Following a major overhaul in 2001, an annual maintenance was established to ensure combine durability and performance. All items listed in the maintenance schedule were inspected and replaced as needed.

The rice equipment pool, including a precision Clampco fertilizer applicator, SWECO 324 plot combine, ALMACO SP40 plot combine, moisture meters, remote temperature stations, and other equipment were used along with personnel who provided technical assistance for numerous field experiments in 2009. The Clampco precision fertilizer applicator was used for the Rice Systems Project at the RES. The SWECO 324 plot combine was used to harvest 5 variety trials, the Rice System Project, 4 entomology tests, and two cold temperature variety tests in the San Joaquin Delta. The ALMACO was used to harvest 6 variety tests, 3 fungicide tests, and 350 pots of a rice quality test. Over 1,500 experimental plots were harvested in 2009. In addition to equipment assistance to other projects, labor from this project was used to plant, collect samples, and monitor growth in several field experiments. Assistance was also provided to the annual RES Rice Field Day and the annual rice breeders' field tour.

Objective IV - Publication and Distribution of Rice Research Information

The following extension education materials were designed, formatted and printed with support from this project:

1. Rice Field Day Program 2009, for the California Cooperative Rice Research Foundation, RES, 42 pp.
2. The UCCE website was updated.
3. UCCE winter grower meetings were held at Colusa and Yuba City.
4. A Rice Production Workshop was held at Colusa.
5. Three activities were held at the RES -- field demonstration on Rice Cultural Systems and Water Quality; the annual California Rice Field day, and the Rice Breeders' tour.

CONCISE GENERAL SUMMARY OF CURRENT YEAR'S RESULTS:

Sixteen on-farm rice variety evaluation trials were conducted throughout the rice growing region of California, with standard varieties compared to preliminary and advanced lines across a range of environments, cultural practices and disease levels. Six similar tests were conducted at the RES in Biggs, CA. Average yields across varieties and locations in the advanced line tests ranged from 9,470 lb/acre in the very early trials to 8,970 lb/acre in the early tests. In the intermediate to late tests the advanced lines average yield was 9,200 lb/acre. Spring rains were minimal, allowing field preparation and planting to be accomplished in a timely manner. Several advanced lines in 2009 produced high yields as well as representing important breeding goals aside from yield (disease resistance, grain quality, specialty types, etc.). Testing advanced and preliminary lines under a variety of conditions remains a critical aspect of releasing varieties adapted to changing cultural practices, markets, and pests.

The overall purpose of evaluating rice production in the western San Joaquin Delta is to find a flood tolerant crop so that these islands could be flooded to prevent the organic soils from oxidizing due to cultivation of upland crops and thus prevent soil subsidence. The special variety tests on Twitchell Island were conducted to determine the feasibility of commercial rice production in an extremely cold environment for rice. The results showed that varieties with good cold tolerance such as Calmochi-101 will produce reasonable yields. However, the variety trials were somewhat variable in yield and clearly blanking due to cold temperatures and shattering due to Delta winds were negative factors in achieving high yields.

Project RM-2 was involved in the planting, sampling and harvesting of more than 15 trial sites throughout the rice growing areas. This project also was also involved in several educational activities including the winter rice grower meetings, a Rice Production Workshop, update of UCCE rice website, rice field days, and promoting work through fact sheets and publications.

S = short; M = medium; L = long; PQ = premium quality; WX = waxy; R = Newrex; LA=low amalose; J=Jasmine; BG=bolt grain; A = aromatic; B=Basmati.

Subjective rating of 1-5 where 1 = poor and 5 = excellent seedling emergence.

Subjective rating of 1-99 where 1 = none and 99 = completely lodged.

Numbers in parentheses indicate relative rank in column.

S = short; M = medium; L = long; PQ = premium quality; WX = waxy; R = Newrex; LA=low amalose; J=Jasmine; BG=bold grain; A = aromatic; B=Basmati.

Subjective rating of 1-5 where 1 = poor and 5 = excellent seedling emergence.

Subjective rating of 1-99 where 1 = none and 99 = completely lodged.

Numbers in parentheses indicate relative rank in column.

Table 9. 2009 Early Rice Variety Test - Butte
