REGIONAL ALMOND VARIETY TRIALS

Planted in 1993

Warren C. Micke, Joseph H. Connell, Paul Verdegaal, Mario Viveros, James T. Yeager, Mary Ann Thorpe and Thomas M. Gradziel¹

Background

Regional Almond Variety Trials (RAVTs) were designed to evaluate newer varieties in a semi-commercial (20 to 40 trees per variety) manner and to compare them to standard varieties such as Nonpareil, Mission and currently accepted pollenizers.

Previous RAVTs were established between 1974 and 1981 in Kern, Colusa, Butte, San Joaquin and Fresno Counties. These trials were planted over several years and had trees of different ages and variety combinations. Thus, the data from these trials were not directly comparable and at this point data collection has ended.

1993 Trials

Three new RAVTs were established in 1993, and this leaflet presents data collected from these trials in 1997. These RAVTs are located in Butte County at the California State University at Chico farm (CSU-Chico), in San Joaquin County at the San Joaquin Delta College farm (Delta College) near Manteca and in Kern County at a Paramount Farming Company orchard (Kern) located south of Shafter and just off of 7th Standard road. At all locations signs are in place to identify each variety.

To be comparable these three new trials were all planted in the same year and with essentially the same variety composition. Thus, any differences in varietal performance among various regions should become evident. The only differences in variety composition among these trials were that Fritz was not included at the CSU-Chico trial (it was in the previous trial at this location) and Dottie Won was added to the Delta College plot. Some trees were planted/replanted after 1993. A few trees of several varieties were not available in 1993. Vandalism and a tornado destroyed a few trees at CSU-Chico and normal replanting has occurred at all locations.

Varieties were planted on peach rootstock; Lovell for those at CSU-Chico and Nemaguard for trees in the Delta College and Kern plots. One exception, Kapareil, is being grown on both peach and peach-almond hybrid rootstocks at all locations, but data isn't always included in this publication for the trees on peach-almond hybrid.

The Kern plot is planted on a Milham sandy loam soil and is irrigated with micro-sprinklers. The trial at CSU-Chico is on a Vina loam soil and is irrigated with solid-set sprinklers. The Delta College trial

¹Warren C. Micke is Extension Pomologist, University of California, Davis. Joseph H. Connell, Paul Verdegaal, and Mario Viveros, are University of California Farm Advisors in Butte, San Joaquin, and Kern Counties, respectively. James T. Yeager and Mary Ann Thorpe are Staff Research Associates with the Pomology Department, University of California, Davis. Thomas M. Gradziel is Associate Professor of Pomology, University of California, Davis.

is on a Delhi loamy sand soil and is flood irrigated. Probably as a result of the coarse textured soil and flood irrigation, the trees in this latter trial are generally somewhat smaller than those in the other two RAVTs.

Varieties Included

Standard varieties are planted 1:1 with new varieties; Nonpareil for the early-mid blooming varieties and Mission for the late blooming varieties to ensure adequate pollination. In the Kern and Delta College trials, varieties are planted as a full row of 29 to 38 trees. With longer rows at CSU-Chico, each row has three different variety sections, with 21 to 25 trees per section. In addition to Nonpareil and Mission, a plot of each of seven "new standard" varieties (other varieties commonly planted today) has been included. These new standard varieties are Butte, Carmel, Fritz (not at CSU-Chico), Monterey, Padre, Price and Sonora.

The new varieties being tested in these trials are Aldrich, Chips, Donna, Dottie Won (Delta College only), Kahl, Kapareil, Jenette, Jiml, Johlyn, Livingston, Morley, Plateau, Rosetta, Ruby, Sano, Savana, Wood Colony and Yokut. While several of these varieties are not new to the almond industry, they had not been adequately tested in the uniform RAVT concept. In addition six numbered selection from a University of California at Davis almond breeding program were included in these trials. These are 1-87, 1-102W, 2-19 E, 2-43W, 13-1 and 25-75.

Data to be collected from these trials include bloom time, hull split/harvest time, yield, and nut quality. Trees in these trials are also being observed and evaluated for growth characteristics, pest and disease susceptibility and noninfectious bud failure symptoms.

1997 Data

This 1997 report includes information, mostly in table or graph form, on bloom time, hull split/harvest time, yields, shelling percentage (percent kernel) and kernel defects. Some information on disease susceptibility is also included. With good bloom time weather in 1997, production from these trees in their **fifth growing season** was generally very good, with some varieties performing exceptionally well. This year a number of varieties produced a high percentage of double kernels in all of the RAVTs. However, with trees only in their fifth growing season, it is really too soon to draw conclusions on production and kernel defects. In the early bearing years tree spacing can have a significant impact on production per acre, and trees per acre vary in these RAVTs with 86 trees per acre in the Kern trial, 64 trees per acre in the CSU-Chico trial and 75 trees per acre in the Delta College trial.

Acknowledgements

The authors wish to thank the Almond Board of California for helping with tree purchase and for continued support of this project. The following nurseries supplied trees at reduced cost for these trials: Bright's Nursery, Burchell Nursery, Dave Wilson Nursery, Fowler Nursery, Sierra Gold Nurseries and Spoto Nursery. We particularly want to express our appreciation and thanks to the staffs of California State University at Chico, San Joaquin Delta College and Paramount Farming Company for excellent cooperation and for managing and maintaining these trials. The assistance of retired farm advisor Donald Rough, Cooperative Extension field assistants in Kern, Butte and San Joaquin Counties and field personnel of the University of California Pomology Department is gratefully acknowledged.

Planted in 1993 at the California State University Farm, Chico

Mission	2-15	2-25	3-06
Ruby	2-15	3-04	3-11
Morley	2-15	2-25	3-13
Savana	2-23	3-06	3-14

Bloom Observations:

Good Blooming Varieties: Aldrich, Monterey, Plateau, Chips, Butte, Padre, 1-87, Livingston, Sonora, Ruby, Rosetta, 2-19E, and Kapareil-Nema.

Average Blooming Varieties: 1-102W, Savana, Kapareil-P.A., Donna, Fritz and Kahl.

Poor Blooming Varieties: Sano, Carmel, Yokut, Price, 13-1, Jiml, and Wood Colony.

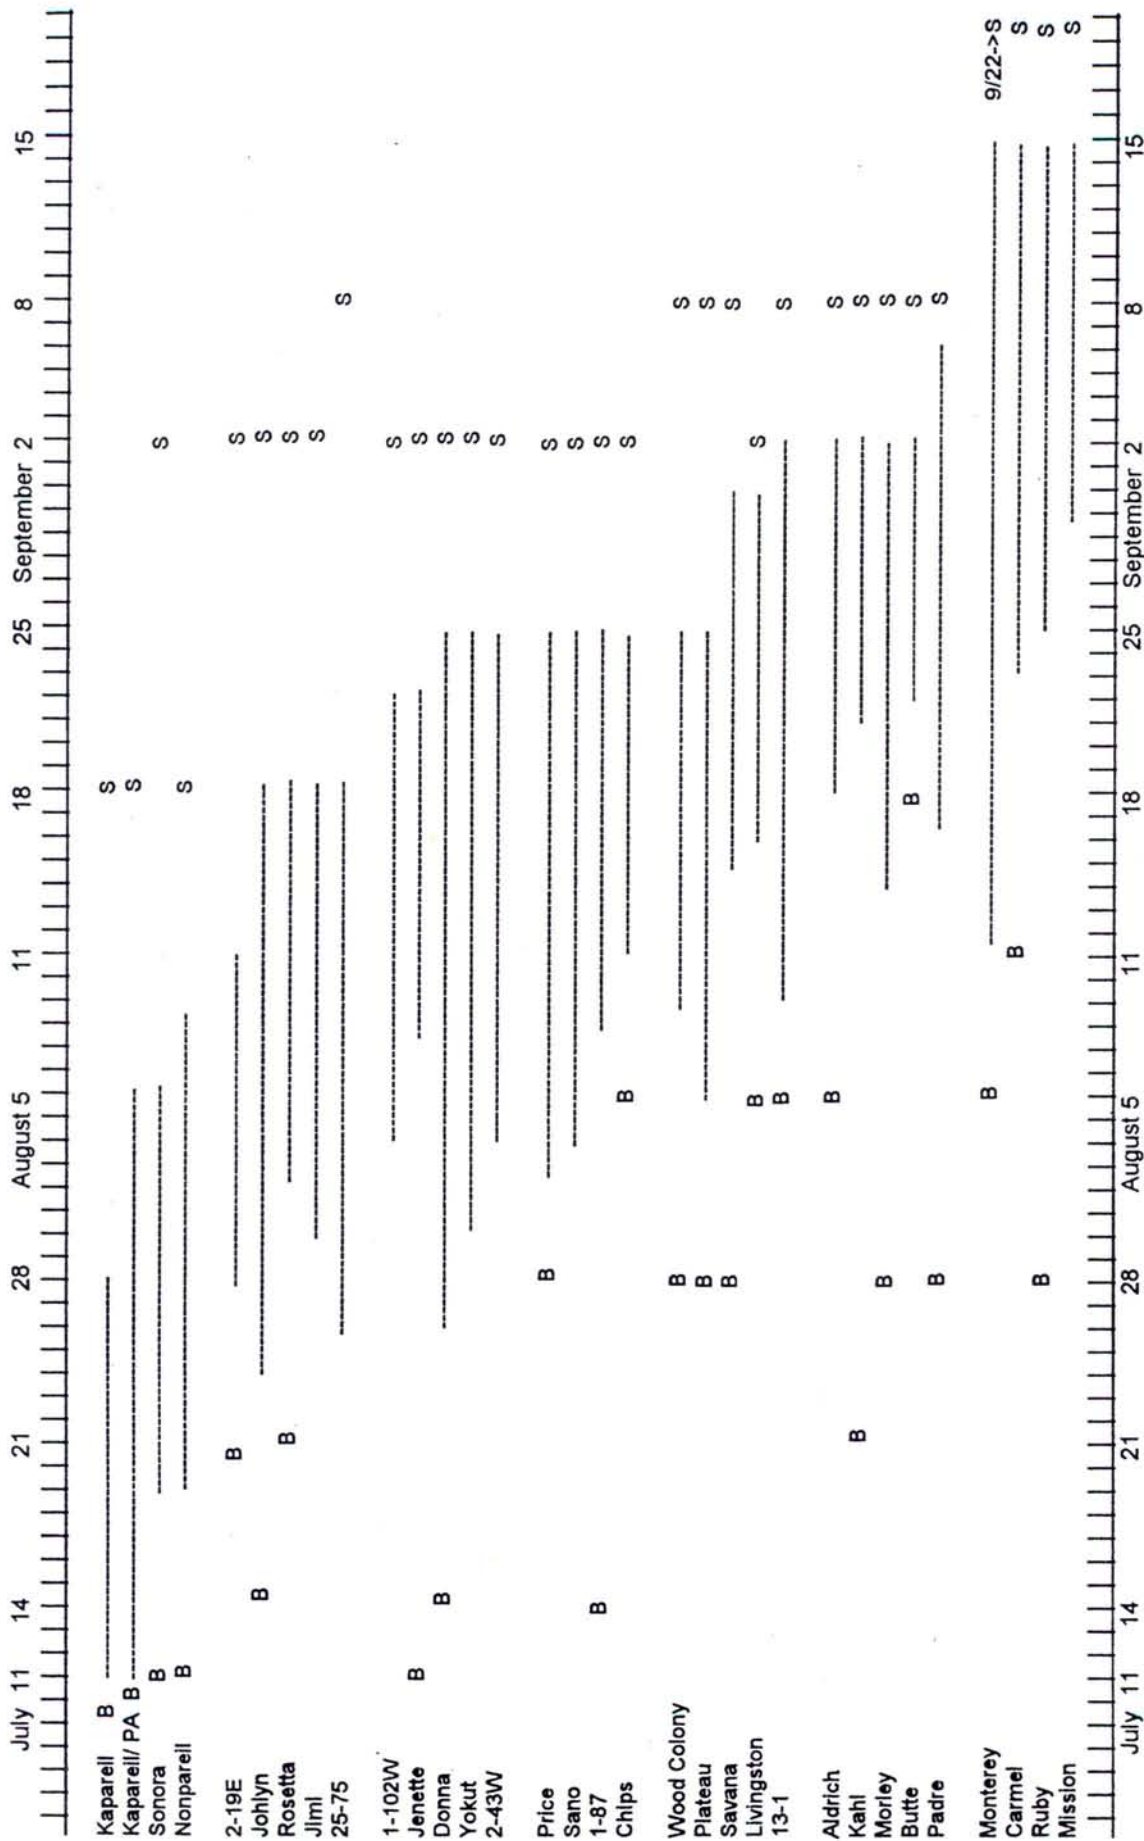

Varieties Blooming with Nonpareil: Monterey, Donna, Jiml, Fritz, Yokut, Price and Aldrich.

Varieties Blooming Ahead of Nonpareil: Sano, Kapareil, Sonora, Rosetta, Kahl, 13-1, Johlyn, Chips, and Jenette.

Chilling Hours: 453 hours of temperatures below 45°F.

ALMOND REGIONAL VARIETY TRIAL - 1997 HARVEST MATURITY

Planted in 1993 at the California State University Farm, Chico

Dashed line encompasses 1 to 100% hullsplit. B -- denotes blanks beginning to split (No B -- indicates that significant blanks were not present or else nuts were hardshells). S -- indicates that the variety was shaken to the ground at the time of the observation. Four harvests were conducted this year to complete harvest in the entire block. This is a cooperative project between The Almond Board of California, California State University-Chico, and University of California Cooperative Extension. Prepared by: Joseph H. Connell, U.C. Farm Advisor, Butte County. 11/10/97.

KERNEL DEFECTS OBSERVED IN 1997

Significant defects noted in the 1997 harvest nut samples of the three RAVTs are outlined below. The trees were only in their fifth growing season. Defects listed may only become important if they continue to show in the same varieties over the next several years as the trees mature.

Defect	Trial		
	CSU-Chico	Delta College ¹	Kern
Varieties with 20% or more double kernels	Kahl Plateau Monterey Donna Sano Price Carmel	Sano Plateau Kahl	Donna Sano Monterey Kahl Carmel 2-43W Wood Colony
10-19% double kernels	Wood Colony Aldrich Jiml 25-75 Mission Ruby	Wood Colony Fritz Aldrich Donna 25-75 Monterey Price Dottie Win	Mission Butte Fritz Price Livingston Plateau Aldrich Jiml 2-19E Ruby 25-75
Varieties with 10% or more twin kernels (two kernels within the same pellicle)	Price	Price Carmel 1-87 25-75	Price
Varieties with more than 5% worm damage (including ant damage) ²	Price (A) ² Jenette (A)	Chips (N) ³ Kapareil (N) Fritz (A) Jiml (N) Johlyn (N) Plateau (N) 2-19E (N)	Monterey (N) Price (P) Chips (A) Sano (A)
Varieties with 10% or more blank kernels	Donna	Johlyn Morley Fritz	Donna Sano Kahl Price

¹Also at Delta College, Livingston and Johlyn had 10 and 8% gummy kernels, respectively.

²Majority of this damage caused by N (navel orangeworm), P (peach twig borer), A (ants)

³Most of the worm damage at the Delta College Trial was caused by Navel orangeworm and may be the result of later than desirable harvest for some of these varieties.
