## Storie Index Soil Rating

R. Earl Storie is Professor Emeritus, Soils and Plant Nutrition and former Soil Technologist in the Experiment Station, Berkeley.

#### The Storie Index

This method of soil rating, known as the Storie Index, is based on soil characteristics that govern the land's potential utilization and productive capacity. It is independent of other physical or economic factors that might determine the desirability of growing certain plants in a given location.

Essentially the present revision sets up a new factor C to evaluate slope; the original factor C is now designated as factor X.

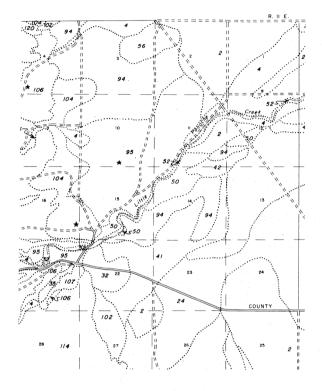

Percentage values are assigned to the characteristics of the soil itself, including the soil profile (factor A); the texture of the surface soil (factor B); the slope (factor C); and conditions of the soil exclusive of profile, surface texture, and slope—for example, drainage, alkali content, nutrient level, erosion, and microrelief (factor X). The most favorable or ideal conditions with respect to each factor are rated at 100 per cent. The percentage values or ratings for the four factors are then multiplied, the result being the Storie Index rating of the soil.

The characteristics of the **soil** profile (factor **A**) are essentially the features of the subsurface layers. For California purposes the soils have been divided into nine profile groups.\* For example, soils that are deep and readily pervious to roots and water (listed in profile group I in the soil-rating chart) are rated at 100 per cent. Profiles with dense clay subsoils (listed in profile group IV on the soil-rating chart) are rated lower. Primary or residual soils (listed in profile groups VII, VIII, and IX) are rated in accordance with the depth to bedrock.

Next, the soils are rated on the basis of the texture of the surface soils (designated as factor B). Medium-textured soils, such as the loams and the silt loams, are rated highest; the extremes in texture, such as sands and clays, lower.

Rating of the slope of the land is considered in factor C. Nearly level or gently sloping land is rated at 100 per cent. As the slope increases, the rating for this

\* Storie, R. Earl, and Walter W. Weir, *Manual for Identifying and Classifying California Soil Series*, 1948, with Supplement, 1958. Published by Associated Students' Store, Univ. of Calif., Berkeley.

factor decreases. **As** shown in the soil-rating chart, single letters are used to indicate simple slopes, and double letters to indicate compound slopes. The percent slope expresses the number of feet rise or fall for 100 feet horizontal distance.

Conditions exclusive of profile, soil texture, and slope are considered in factor **X** on the soil-rating chart. These conditions consist of drainage, alkali or salt content, general nutrient level, acidity, erosion, and microrelief (surface regularity). If two or more conditions exist that are listed under factor **X**, the ratings for each are treated independently; that is, they are multiplied in order to secure the factor **X** rating.

#### Soil Grading

For simplification. six soil grades have been set up in California by combining soils having ranges in index rating as follows:

Grade 1 (excellent): Soils that rate between 80 and 100 per cent and which are suitable for a wide range of crops. including alfalfa. orchard. truck. and field crops.

Grade 2 (good): Soils that rate between 60 and 79 per cent and which are suitable for most crops. Yields are generally good to excellent.

Grade 3 (fair): Soils that rate between 40 and 59 per cent and which are generally of fair quality. with less wide range of suitability than grades 1 and 2. Soils in this grade may give good results with certain specialized crops.

Grade 4 (poor): Soils that rate between 20 and 39 per cent and which have a narrow range in their agri cultural possibilities. For example, a few soils in this grade may be good for rice, but not good for many other uses.

Grade 5 (very poor): Soils that rate between 10 and 19 per cent are of very limited use except for pasture. because **of** adverse conditions such as shallowness. roughness. and alkali content.

Grade 6 (nonagricultural): Soils that rate less than 10 per cent include. for example, tidelands, riverwash, soils of high alkali content, and steep broken land.

#### Rating the Soil for a Tract of Land

The index for each soil type in the tract is calculated separately, and then a rating for the entire tract is obtained by weighing each soil index according to the proportion of the acreage of that soil in the tract. As an example, using the soil map on the back page the rating of the tract is determined as follows:

1. Index for the area YI-A (Yolo loam, nearly level): This is a recent alluvial soil, deep, smooth, well drained.

Rating in

dramed.	Rating in
	per cent
Factor $A$ : Yolo series, profile group $I$	. 100
Factor B: loam texture	. 100
Factor C: slope A, nearly level	. 100
Factor $X$ : no other modifying factors	. 100
Indexrating=100%x100%x100%x100%=10	00%

**2.** Index for Ac-BB (Antioch clay loam, undulating): This is a claypan terrace soil with undulating topography.

Rating in

	pe	cent
Factor A: Antioch series, profile group IV		60
Factor B: clay loam texture		85
Factor C: undulating topography		95
Factor $X$ : no other modifying factors	•	100
Index rating = $60\% \times 85\% \times 95\% \times 100\% = 48\%$		

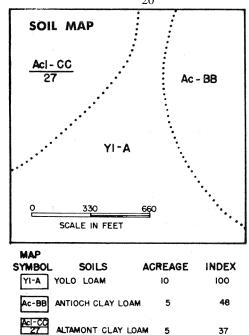

3. Index for Acl-CC (Altamont clay loam, rolling): This is *a* brown upland soil from shale parent material; redrock at a depth of 3 feet. Rolling topography, moderate sheet erosion, with occasional gullies.

	R	atin	ating in	
		per	cent	
Factor <b>A</b> : Altamont series, profile group VIII				
Factor B: clay loam texture Factor C: rolling topography		•	85 90	
Factor X: moderate sheet erosion with shallow		•		
gullies			70	
Index rating = $70\% \times 85\% \times 90\% \times 70\% = 37\%$ .				

**4.** The index for the entire tract shown on the map may then be calculated according to the acreage **of** each soil, as follows:

				Index	Α	creag	e	
•			-	48	х	5	=	240
•	•	•	•	37	х	5	=	185
						20		1.425
	•				· · · · · 100 · · · · 48	100 <i>x</i> 48 <i>x</i>	100 x 10 48 x 5 37 x 5	Index Acreage $ \begin{array}{ccccccccccccccccccccccccccccccccccc$

Index rating for the tract = 
$$\frac{1,425}{20}$$
 \_ 71%.

THIS LEAFLET is a revision of the soil-rating chart published originally by the author in Bulletin 556, An Index for Rating the Agricultural Value of Soils, 1933, and later in the revised edition of 1937,
