

Tuning up your drip irrigation system: pressure regulation, system design, and scheduling.

University of California
Agriculture and Natural Resources

**Michael Cahn Irrigation and Water Resources Advisor
UCCE Monterey, San Benito, and Santa Cruz Counties**

Benefits of a high Irrigation Efficiency

Conserve water

**Fertigate
uniformly**

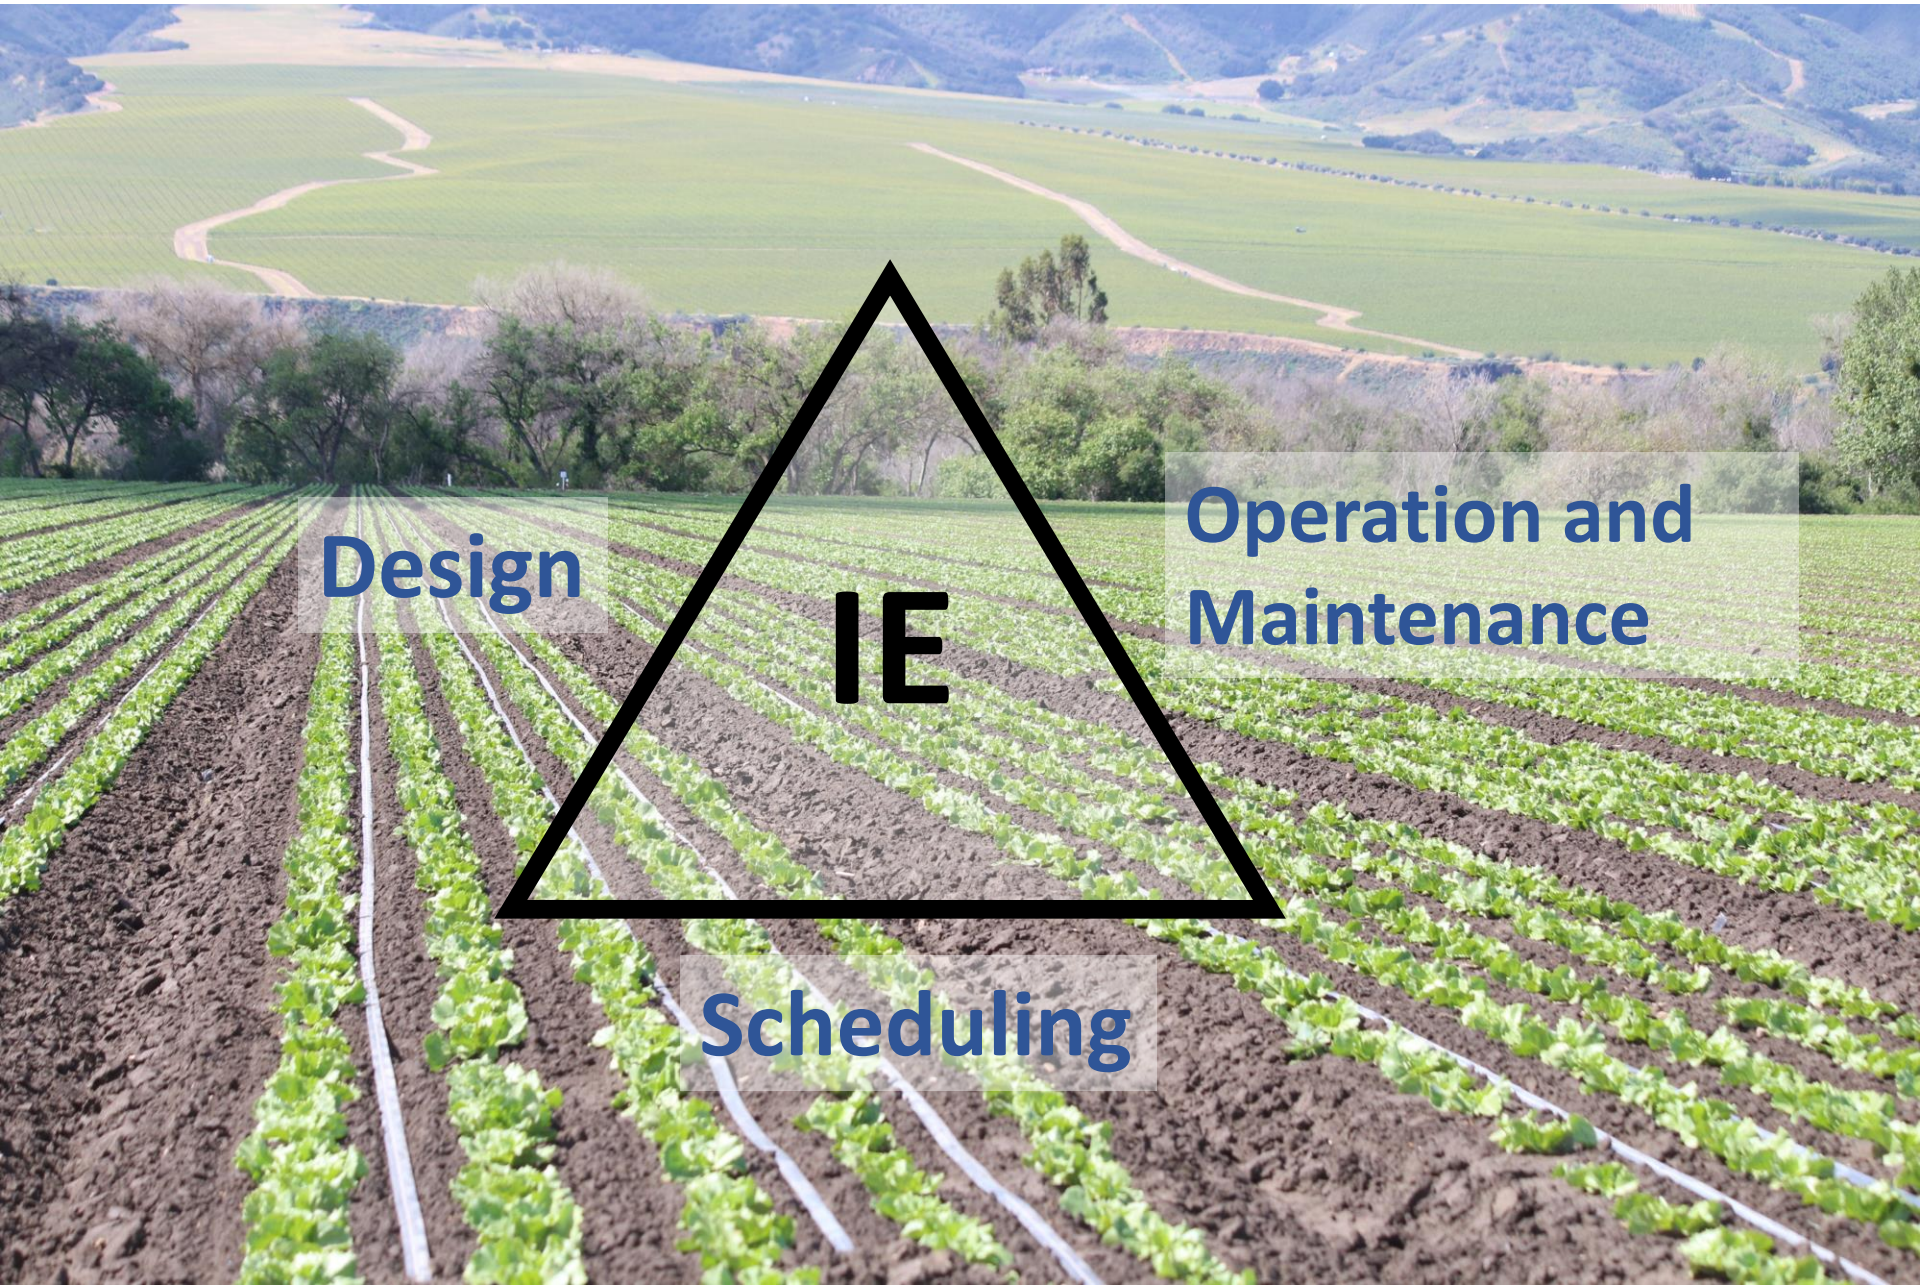

**Minimize nutrient
losses**

Save Money

3 Sides to Achieving High Irrigation Efficiency

Design

IE

**Operation and
Maintenance**

Scheduling

Management of Pressure is Key to Achieving a High Application Uniformity with Drip

Discharge rate of drip tape varies with pressure

Factors that increase pressure variation

**ELEVATION
CHANGE**

**UNDERSIZED
FITTINGS AND PIPE**

**DRIP LINES ARE
TOO LONG**

2.3 feet of elevation change = 1 psi

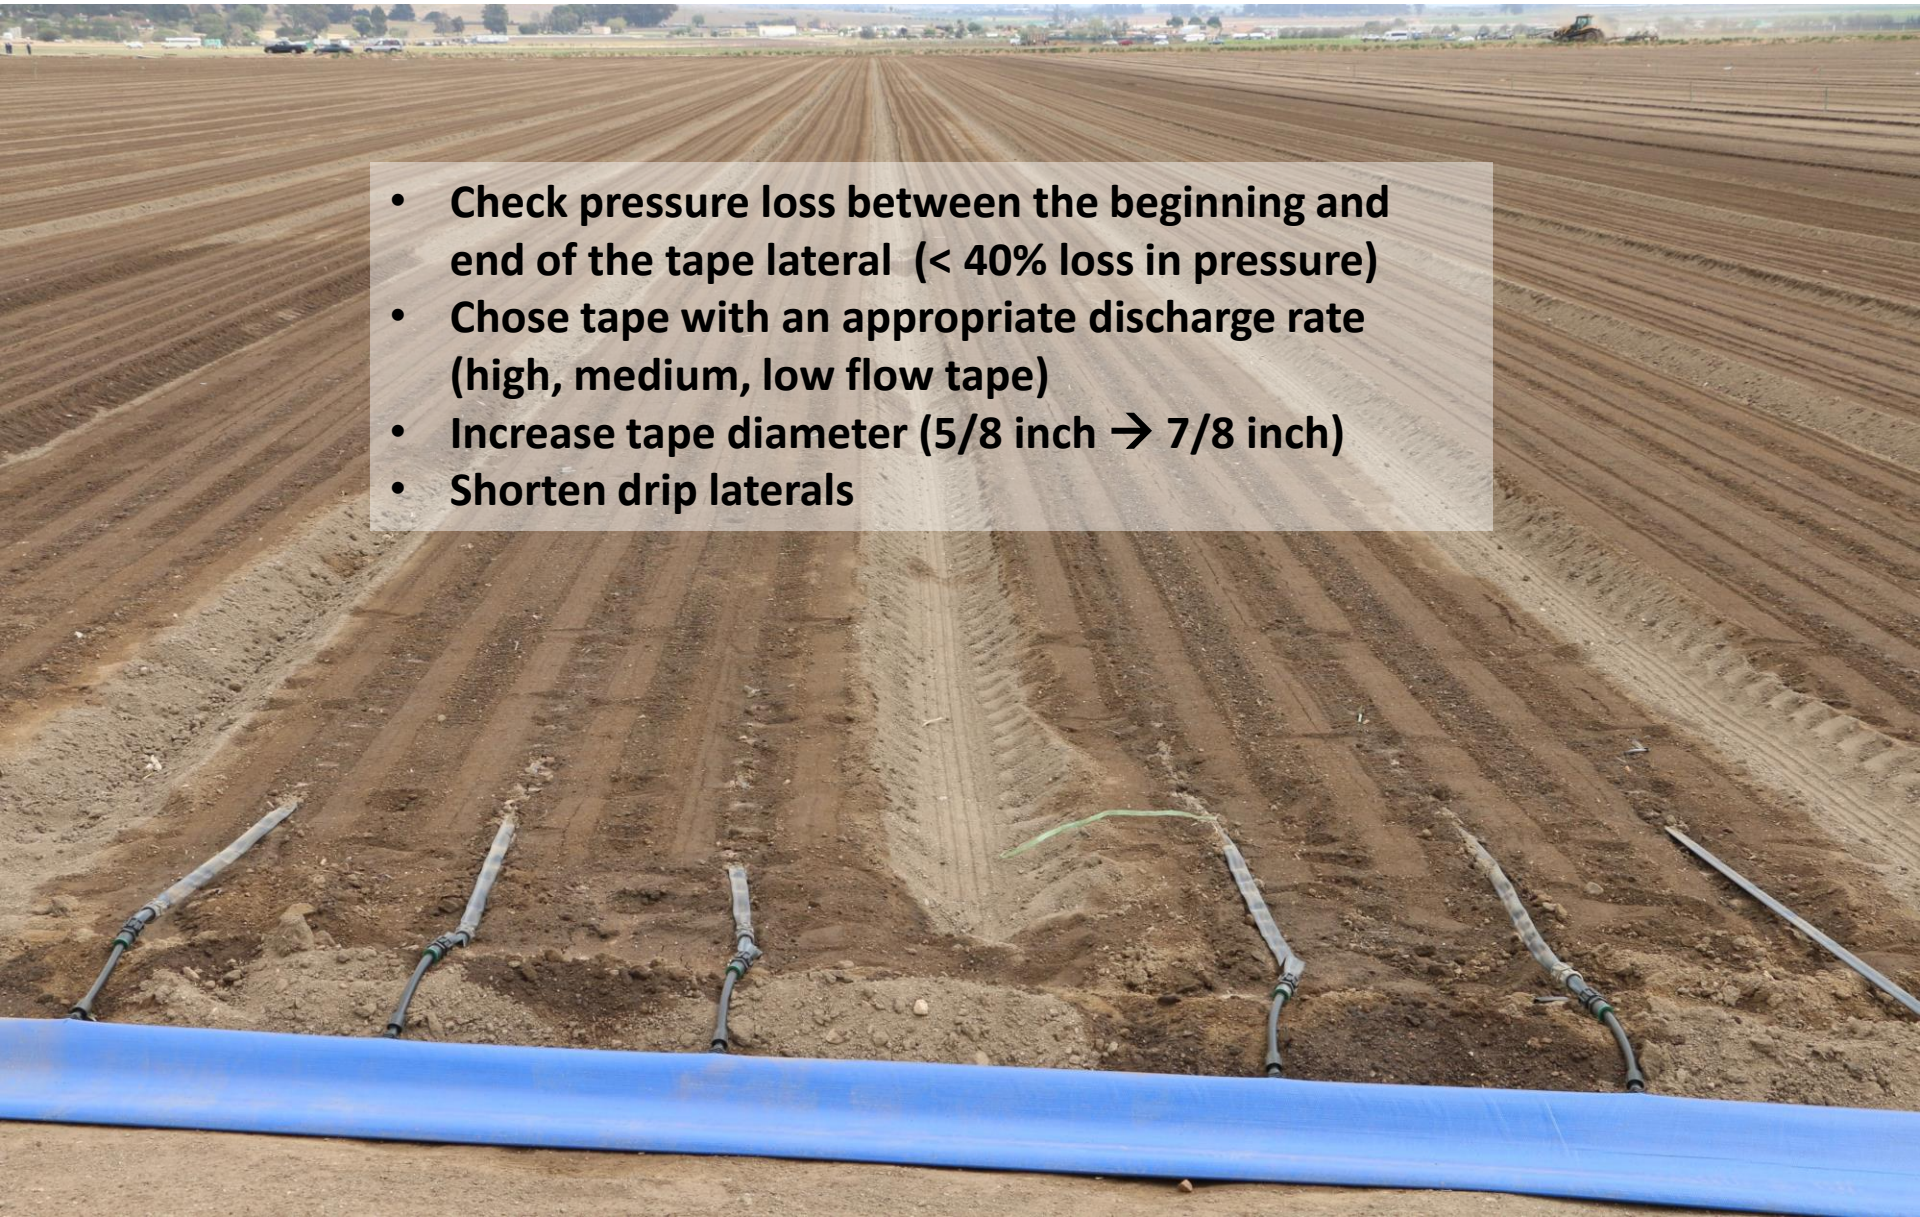

**Or a 10 ft change in elevation would affect the pressure
by 4.3 psi**

Undersized connections between the main and submain can cause excessive pressure loss

Assure that the pressure loss along the length of the drip lines is not excessive

- Check pressure loss between the beginning and end of the tape lateral (< 40% loss in pressure)
- Chose tape with an appropriate discharge rate (high, medium, low flow tape)
- Increase tape diameter (5/8 inch → 7/8 inch)
- Shorten drip laterals

For very long beds (>1000 ft): Placing the submain a third of the way down the field minimized pressure differences and improved distribution uniformity

Many irrigators adjust a valve to regulate pressure of drip systems

If pressure varies then the flow rate of the drip system will vary

Monitoring pressure is more complicated than it seems

- Mechanical pressure gauges on an irrigation system are often inaccurate, in the wrong location, or broken.
- New mechanical pressure gauges may be inaccurate by as much as 1 to 2 psi (10% to 20% error for tape at 10 psi).

Use Schrader valves and calibrated pressure gauges

Periodically check the calibration of all pressure gauges

Pressure regulators can help

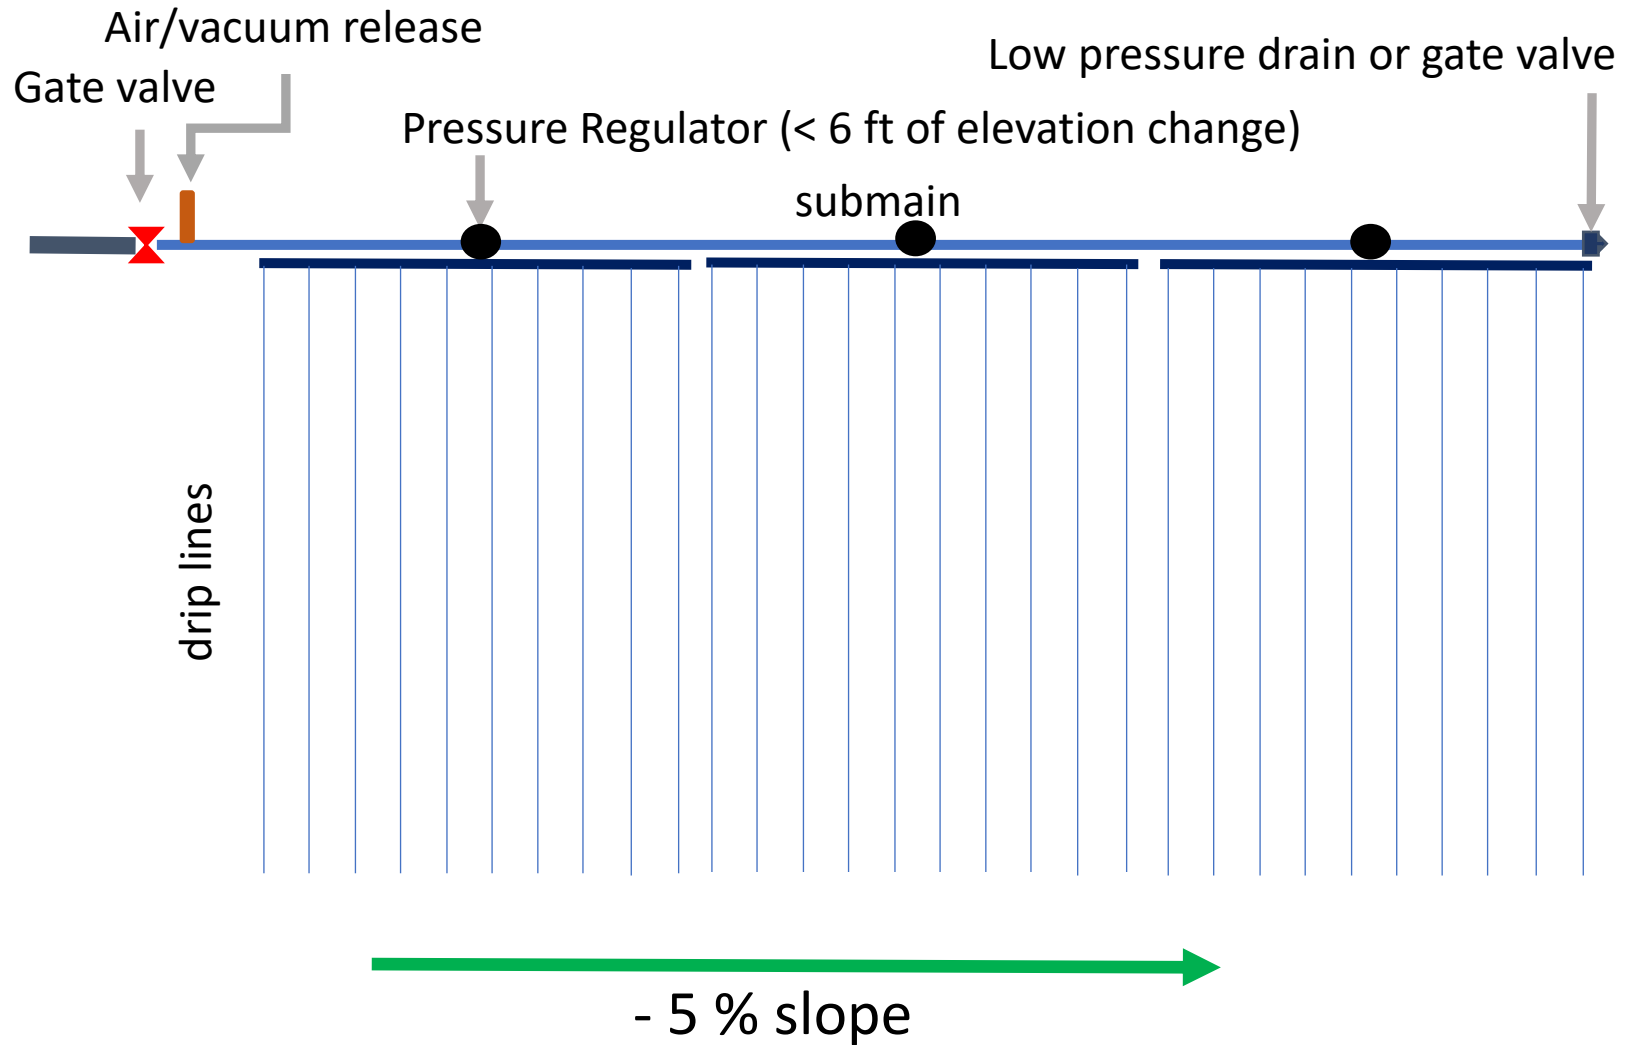

Non adjustable Pressure Regulators

- Up to 3-inch diameter
- Suitable for a limited range of flowrates (< 80 gpm)
- Durable (few parts)
- Fast reacting to changes in upstream pressure
- Maintain a consistent pressure downstream if within the flow rate range

Designing a submain along a slope

Adjustable pressure reducing valve (PRV)

Bonnetts

Pilot

Typical operational and maintenance problems:

- Difficulty adjusting pressure at pilot
- Slow reaction time to changes in upstream pressure
- Need to reset pilot with each irrigation
- Flow rate outside the range of the valve
- Disconnected/broken tubes and fittings
- Clogged filters
- Trapped air

Improved Pressure Reducing Valves for large Drip Systems

- Easy to adjust
- Suitable for a large range of flow rates
- Fast reacting to changes in upstream pressure
- Maintains a consistent pressure downstream without adjustment
- Rugged

Pressure regulating valve minimized variability in the application rate of the drip system during the growing season

No regulating valve

Regulating valve

Tools for Irrigation Scheduling

Weather (ET)-based

Plant-based

Soil-based

Flowmeters are useful tools for irrigation scheduling

Weather-based irrigation scheduling

Converting Reference ET to Crop ET:

$$ET_{\text{crop}} = ET_{\text{ref}} \times K_{\text{crop}}$$

K_c can vary from 0.1 to 1.2

CropManage: Online irrigation and nitrogen management decision support

Irrigation Method *
Drip

Recommendation ⓘ
6.4 hours
Recommendation Summary ^

Average ET ⓘ	0.08 in./day
Average Crop Coefficient ⓘ	0.9
Distribution Uniformity ⓘ	90%
Days Since Last Irrigation ⓘ	15 days
Leaching Requirement ⓘ	0%
Total Precipitation ⓘ	0.34 in.

Total Crop ET = Average ET x Average Crop Coefficient x Days Since Last Irrigation
1.05 in. = 0.08 x 0.90 x 15

Recommended Irrigation Amount = Total Crop ET x 100 / (Distribution Uniformity x (1 - Leaching Requirement)) - Total Precipitation

When to irrigate?

Soil Moisture Sensors

Tension

Volumetric

An integrated, portable filter station for drip

Datalogger and cellular modem

Pressure regulating valve

Flowmeter

Filter

Pressure sensors

Fertilizer injection port

Red layflat is rated up to 100 psi

Summary

- Achieving a high irrigation efficiency can maximize yield and quality as well as save water, fertilizer, and money.
- Design, operation and maintenance, and scheduling all affect irrigation efficiency.
- Pressure management is key to achieving high application uniformity in drip
- Tools such as flowmeters, soil moisture sensors, ET data, and calibrated pressure gauges can help you assess if you are applying water uniformly and matching irrigation applications with crop water needs.
