

# Site-Specific Nutrient Management for Onion Production: Soil Fertility and Fertilizer Usage Comparison

California Garlic and Onion  
Symposium 2010

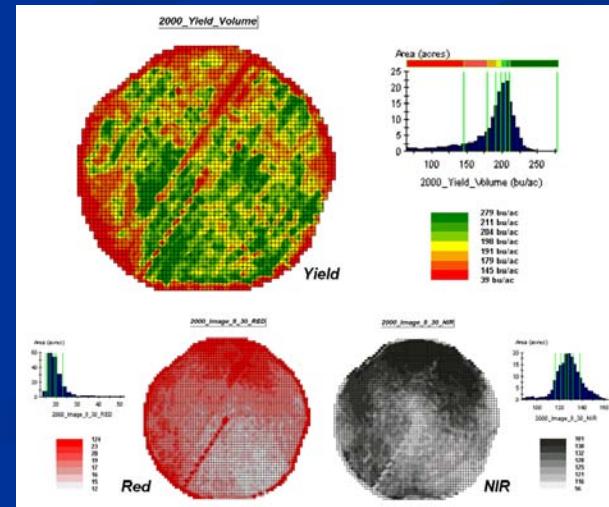

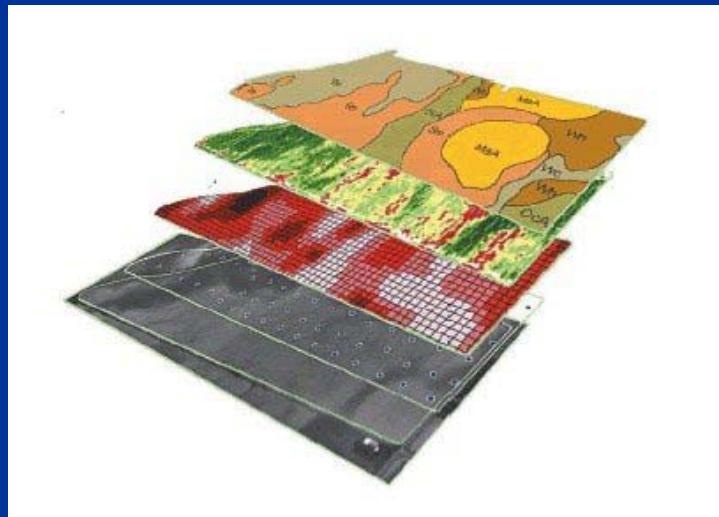

Andre Biscaro and Steve Orloff  
UC Cooperative Extension

Tulare, February 8<sup>th</sup> 2010

# Site-Specific Management (SSM) - Precision Agriculture

- Integration of ‘spatial technology’ tools to agronomic practices in order to identify and manage soil and crop variability

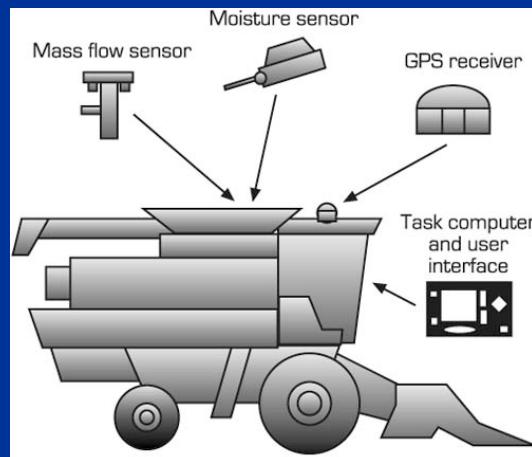

# How did SSM start?

1980's and mostly 1990's:

Yield monitors for grain crops

- Midwest

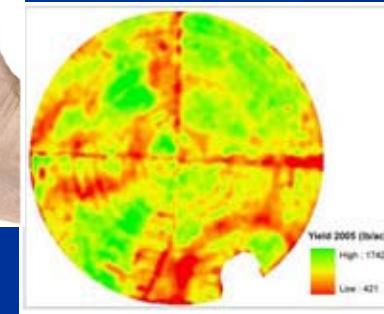

GIS development

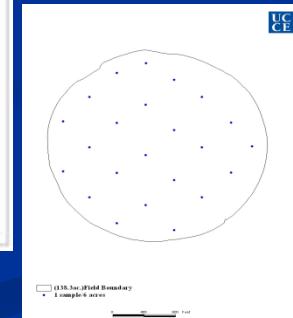

GPS open for  
civilian use +  
more accurate

Yield maps

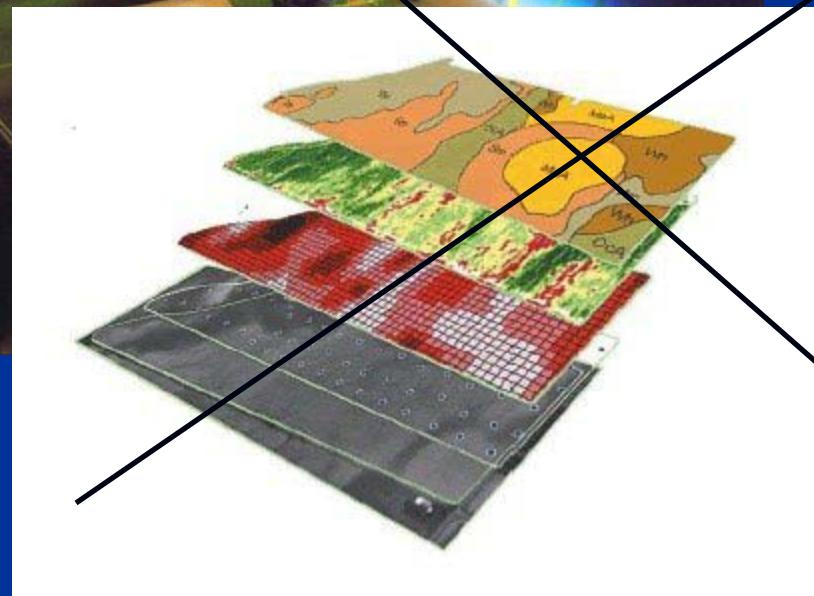

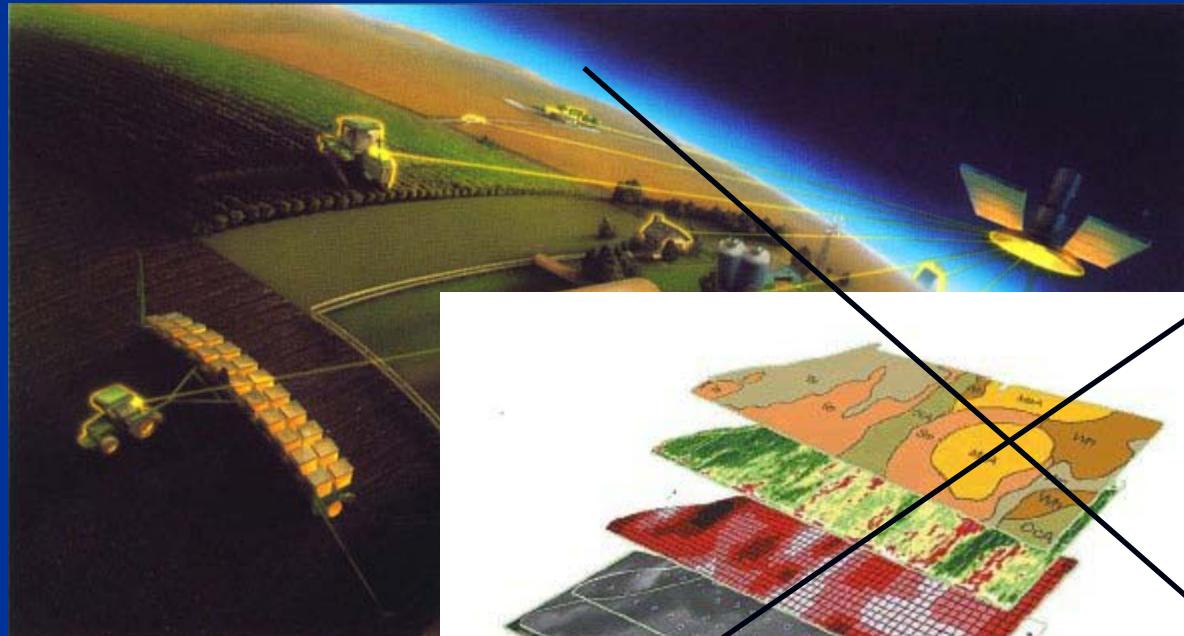

Sampling Grid

Products were launched in the Ag. market

Lack of technical support = frustration and skepticism

# SSM Today

- Recognized by science societies and research institutes
- Education opportunities are increasing
- More options of equipment and more user friendly
- Technical support is more readily available

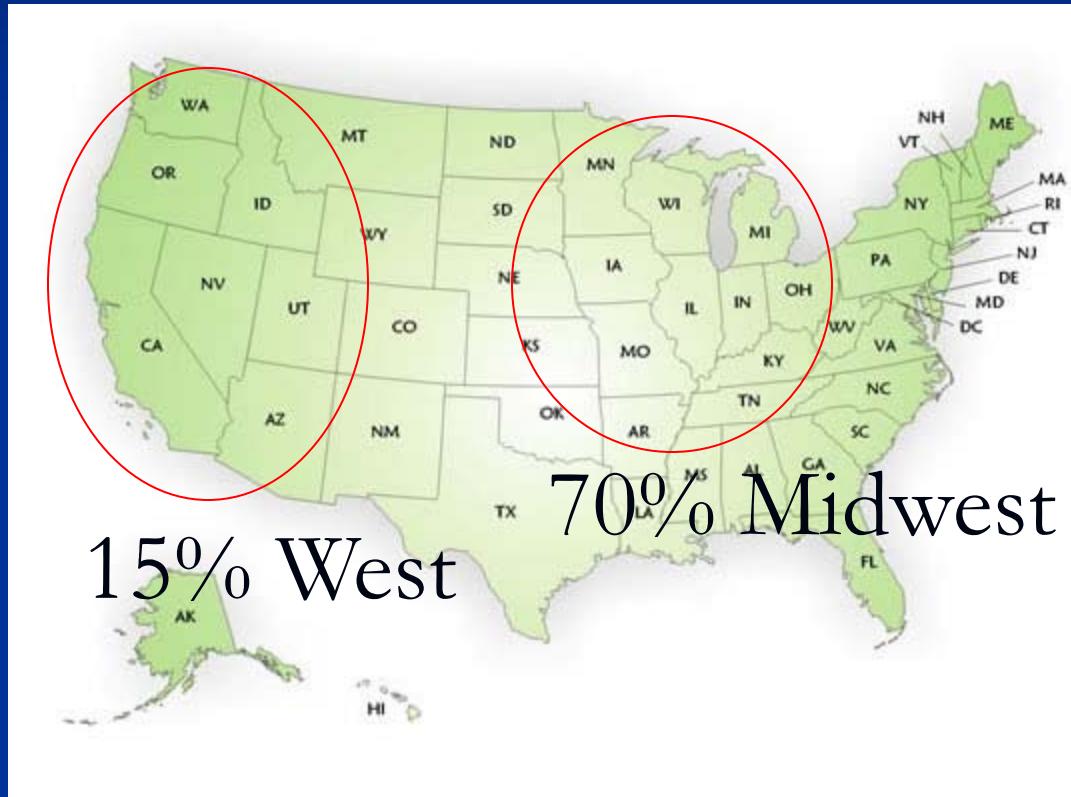

- Growers should expect SSM services from Crop consultants, Cooperatives and Fertilizer dealers

# Early adopters are today's main users:

## Why?

- Where tech. developed
- Type of crops
- Farm sizes
- Support from Univ., coops and dealerships

(Whipker and Akridge, 2008)

## Possible Barriers

West

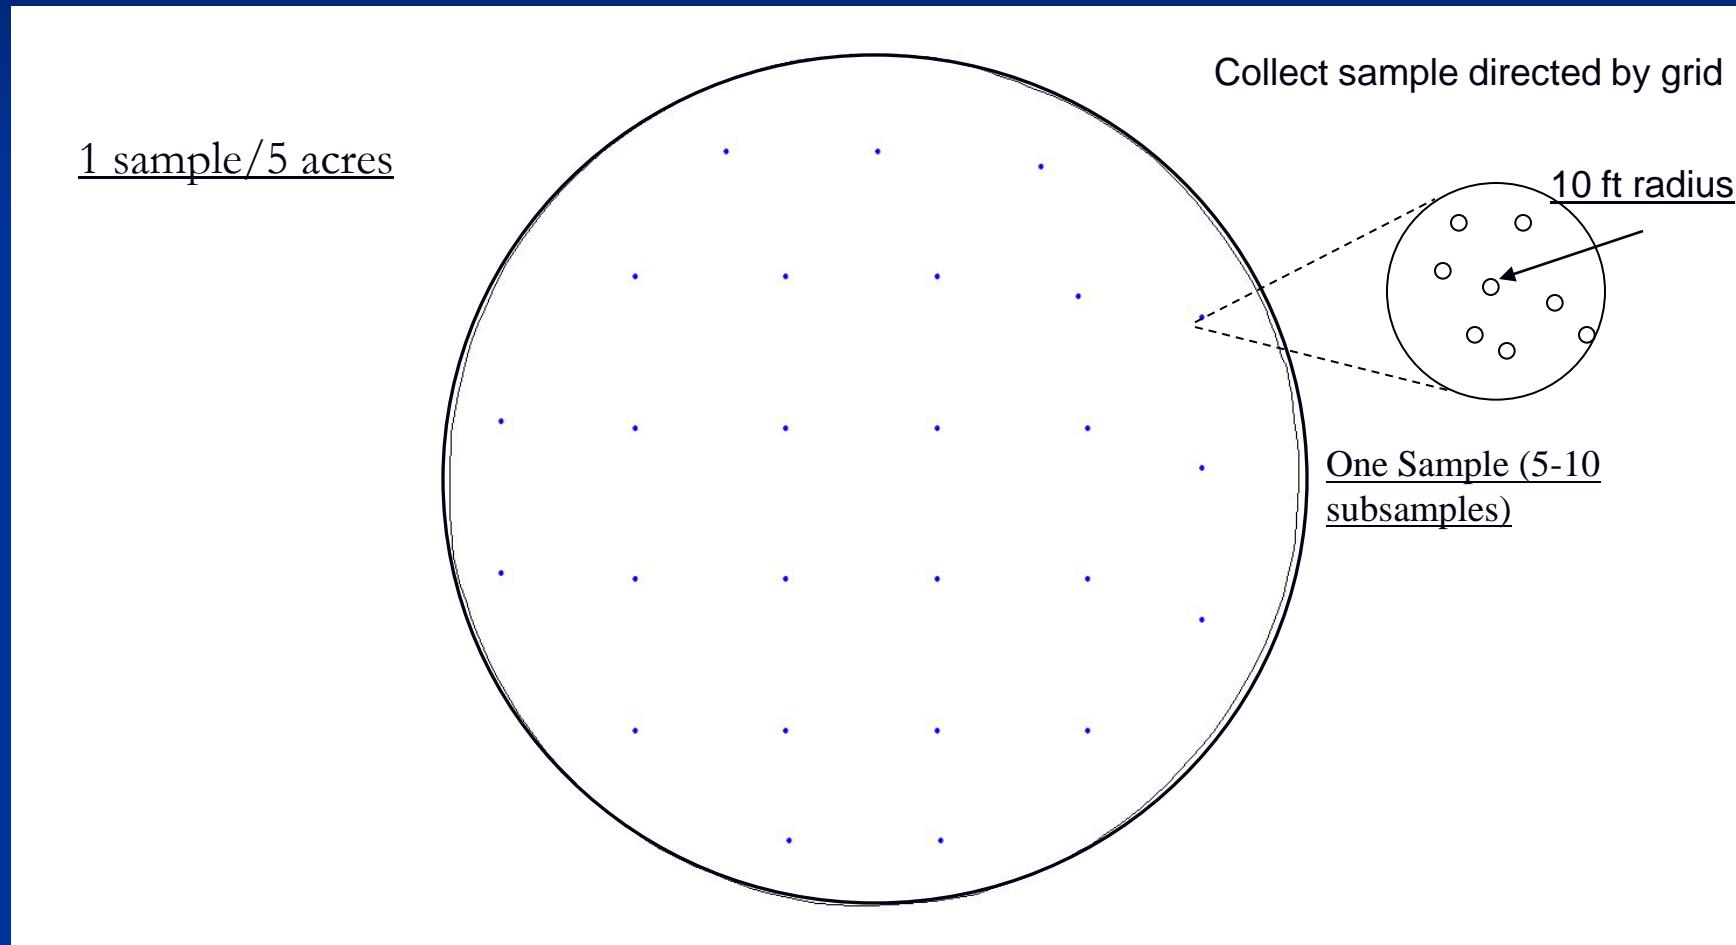

- Lack of understanding and educational programs?
- Western growers unaware of the variability that can occur in their fields?
- Perceived cost involved?

# Project's scope

- Document the degree of variability that occurs in onion fields in the High Desert
- Explore the benefits of variable rate fertilization
- Assess the number of soil samples that need to be collected to characterize a field
  - North and South Fields, Lancaster, CA
  - 6 onion fields, ~400 acres
  - Soil P and K
  - 1 sample/5 acres

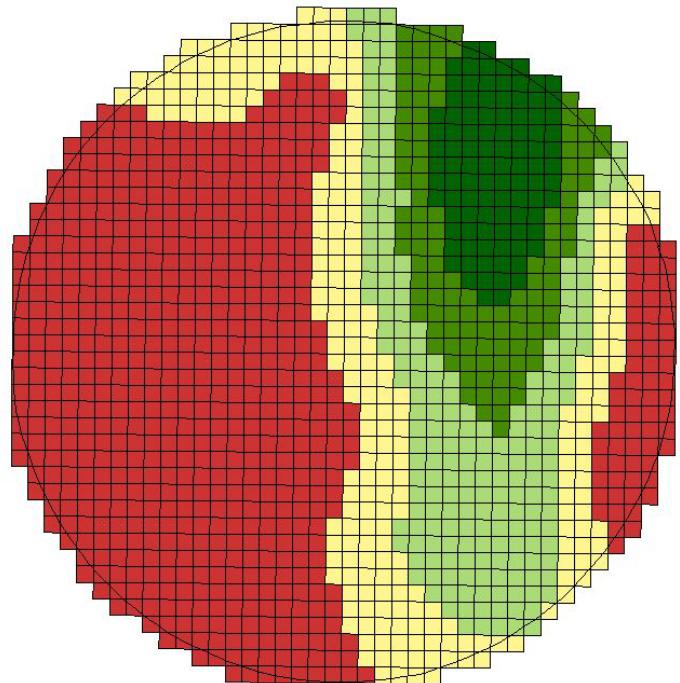

# Detecting Soil P and K Variability

# Phosphate Fertilization Method

$$\{[300 - (P_{\text{ppm}} * 4.6)] * 1.92\} * 0.66$$

where:

- 300 = goal of P<sub>2</sub>O<sub>5</sub> in the soil (ppm);
- P<sub>ppm</sub> = amount of soil P (ppm) assessed through chemical analysis;
- 4.6 = 2.3 \* 2, where 2.3 was used to convert P to P<sub>2</sub>O<sub>5</sub>, and 2 was used to convert ppm to lbs of P<sub>2</sub>O<sub>5</sub> per acre;
- 1.92 = the proportion between lbs of P<sub>2</sub>O<sub>5</sub> and lbs of 11-52-0 (fertilizer used);
- 0.66 = since the fertilizer was banded, only the area of the beds was considered.

# Potash Fertilization Method

$$\{[117 - (K_{\text{ppm}} * 2.4) + 100] * 2\} * 0.66$$

where:

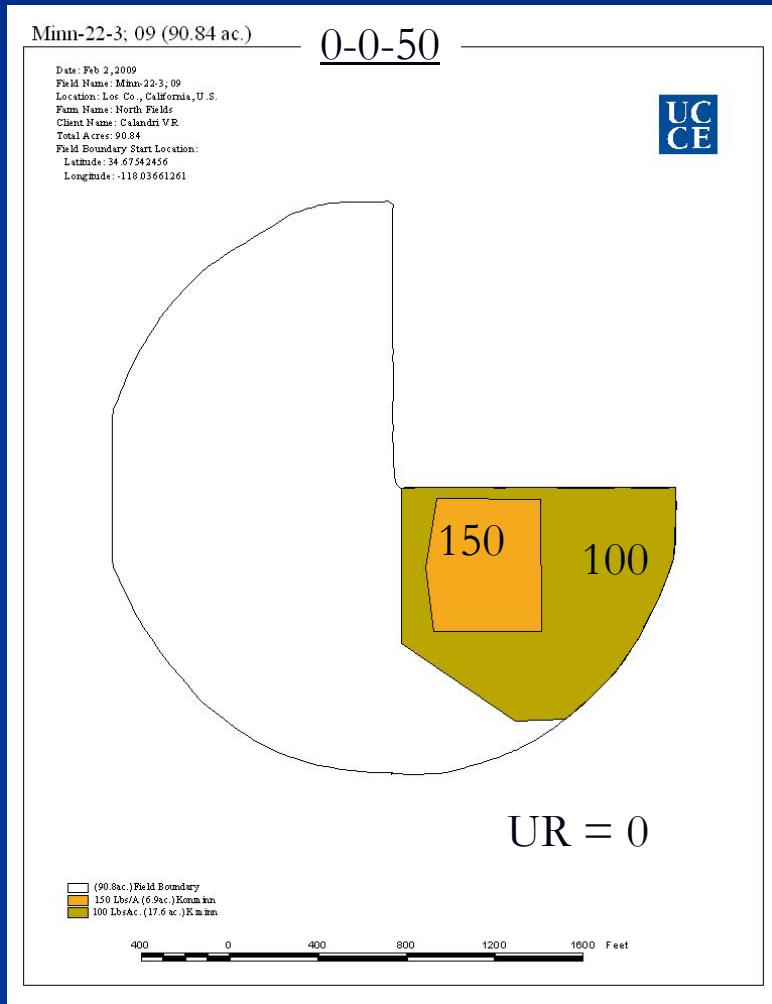

- 117 = goal of K<sub>2</sub>O in the soil (ppm);
- K<sub>ppm</sub> = amount of soil K (ppm) assessed through chemical analysis;
- 2.4 = 1.2 \* 2, where 1.2 was used to convert K to K<sub>2</sub>O, and 2 was used to convert ppm to lbs of K<sub>2</sub>O per acre,
- 100 = accounts for an addition of 100 extra units of K<sub>2</sub>O
- 2 = the proportion between lbs of K<sub>2</sub>O and lbs of 0-0-50 (fertilizer used);
- 0.66 = banded fertilizer

\*CEC = 6meq/100g

	<i>Subtotal</i>	<i>17,248</i>	<i>17,516</i>	
<b>Total Difference</b>				<b>-1,575</b>
<i><b>More Fertilizer with VR</b></i>				

<sup>†</sup>Potash = 0-0-50 (U\$0.55/Lb)

<sup>††</sup>Phosphate = 11-52-0 (U\$0.27/Lb)

<sup>†††</sup>Difference = UR minus VR

# Improve farm management:

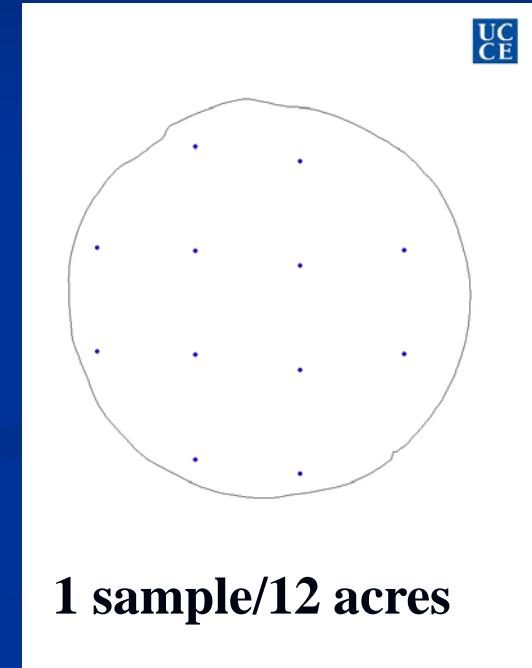

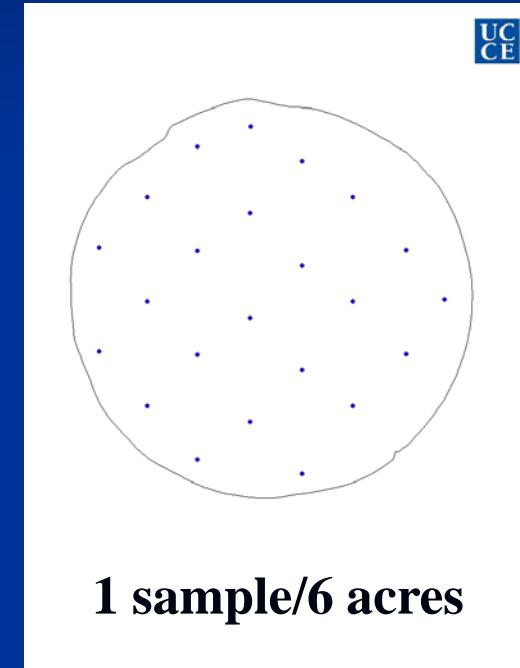

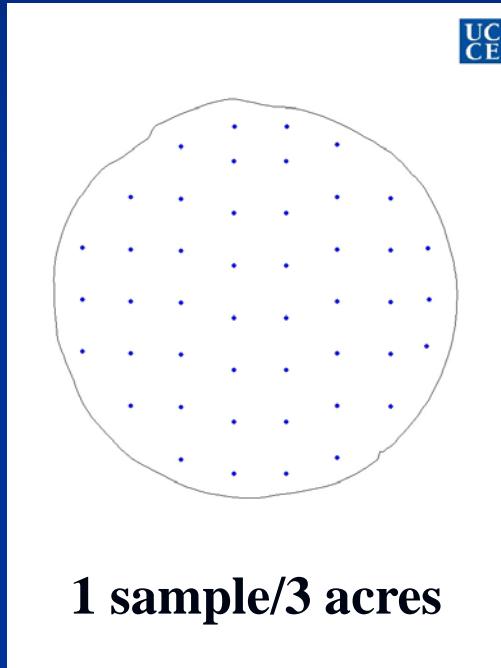

## ■ Agronomical perspective:

- Yield increases in portions of the fields by avoiding under-fertilization and improving crop nutritional status
- Better quality: reducing or eliminating over-fertilization

## ■ Economical perspective:

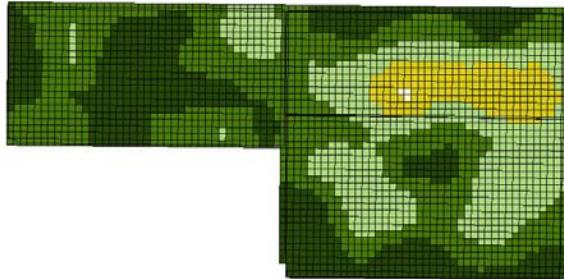

- Potential fertilizer savings by avoiding over-fertilization  
= \$4,600 saved on 3 onion fields (North Region)

# Soil Analysis Costs

1 sample/5 acres

- \$11/analysis (P, K, pH, CEC, Ca, Mg, S)

Obs: Approx. 7 min/sample

- North fields: 211 acres = 42 samples = \$462 (soil analysis); fertilizer savings = \$4,600
- South fields: 183 acres = 36 samples = \$396 (soil analysis); fertilizer savings = - \$1,575
- Overall (400 acres): \$858 analysis and \$3,000 fertilizer savings (in addition to possible yield increases)

- ✓ Next sampling: direct only a few samples inside of each fertility zone

# Conclusions

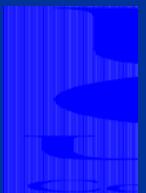

- The onion fields assessed on this study presented significant soil P and K variability
- Whether or not VR application results in an actual fertilizer savings is secondary, and depends on whether conventional sampling (UR) generally over or underestimates the fertility level

# Conclusions

- The important point is that with grid sampling the VR fertilizer application better matches the actual fertility needs of the field
- Sampling every 6 acres was sufficient to characterize soil P and K spatial variability for the majority of the fields of this study
