

# Biomass Conversion Technologies: Heat, Electricity, and Liquid Fuels

*Woody Biomass Workshop*

*Tulare, CA*

*May 5, 2009*

John R. Shelly, UC Berkeley

# Global Carbon Cycle (billion metric tons)

+ 3.2 Billion tons per year to atmosphere

# US Energy Demand

Source: Energy Information Administration: Annual Energy Outlook 2007

# US Renewable Fuel Demand

Source: Renewable Fuels Association 2007

# Biomass ?

- Animal related
- Plant related – lignocellulosic materials
  - Woody – More than 10% lignin  
*stems and branches of trees and shrubs*
  - Non-Woody – less than 10% lignin  
*grasses, non-tree agricultural crops*

# Woody Biomass – more than just small trees

- Forest-based, non merchantable trees and residues
- Urban Wood Waste stream
  - Construction and demolition wood
  - Post-consumer use wood products
  - Tree removals and trimmings
- Chaparral
- Energy plantations?

Commercial Timberland - Biomass ?

Harvesting Residues

Idyllwild, CA – Population ~ 4,000

Dense Stand of Small Diameter Trees

Urban Woody Waste

# California Biomass in 2005

Gross Total = 80 million BDT/year

## Available

million BDT

AR = 9

F = 12

WM = 2

C = 0

U = 8

Total = 31

What Role Will Biomass Play in  
Helping Meet the Ever-Growing  
Demand for Energy?

# Biochemical Potential

	Softwoods	Hardwoods
Cellulose	40-44 %	43-47 %
Hemicellulose	25-29	25-35
Lignin	25-31	16-24
Extractives	1-5	2-8
Ash	< 1	< 1

# Organic Chemicals from Biomass

*Many Valuable Chemicals can be Made from Wood*

- **Pharmaceuticals** -- Extraction
- **Fragrances** -- Extraction
- **Charcoal, phenolic oils,** -- Pyrolysis
- **Alcohols** - Thermochemical, Hydrolysis/Fermentation
- **Bio-Gases** (low BTU, high CO) -- Gasification
- **Levulinic and Lactic acid** (“building blocks”) –  
– Hydrolysis/Conversion

# Conversion Pathways

## Combustion

Heat  
Electricity

## Biochemical

- Anaerobic digestion
- Hydrolysis/Fermentation

Alcohol  
Other organic chemicals

## Thermochemical

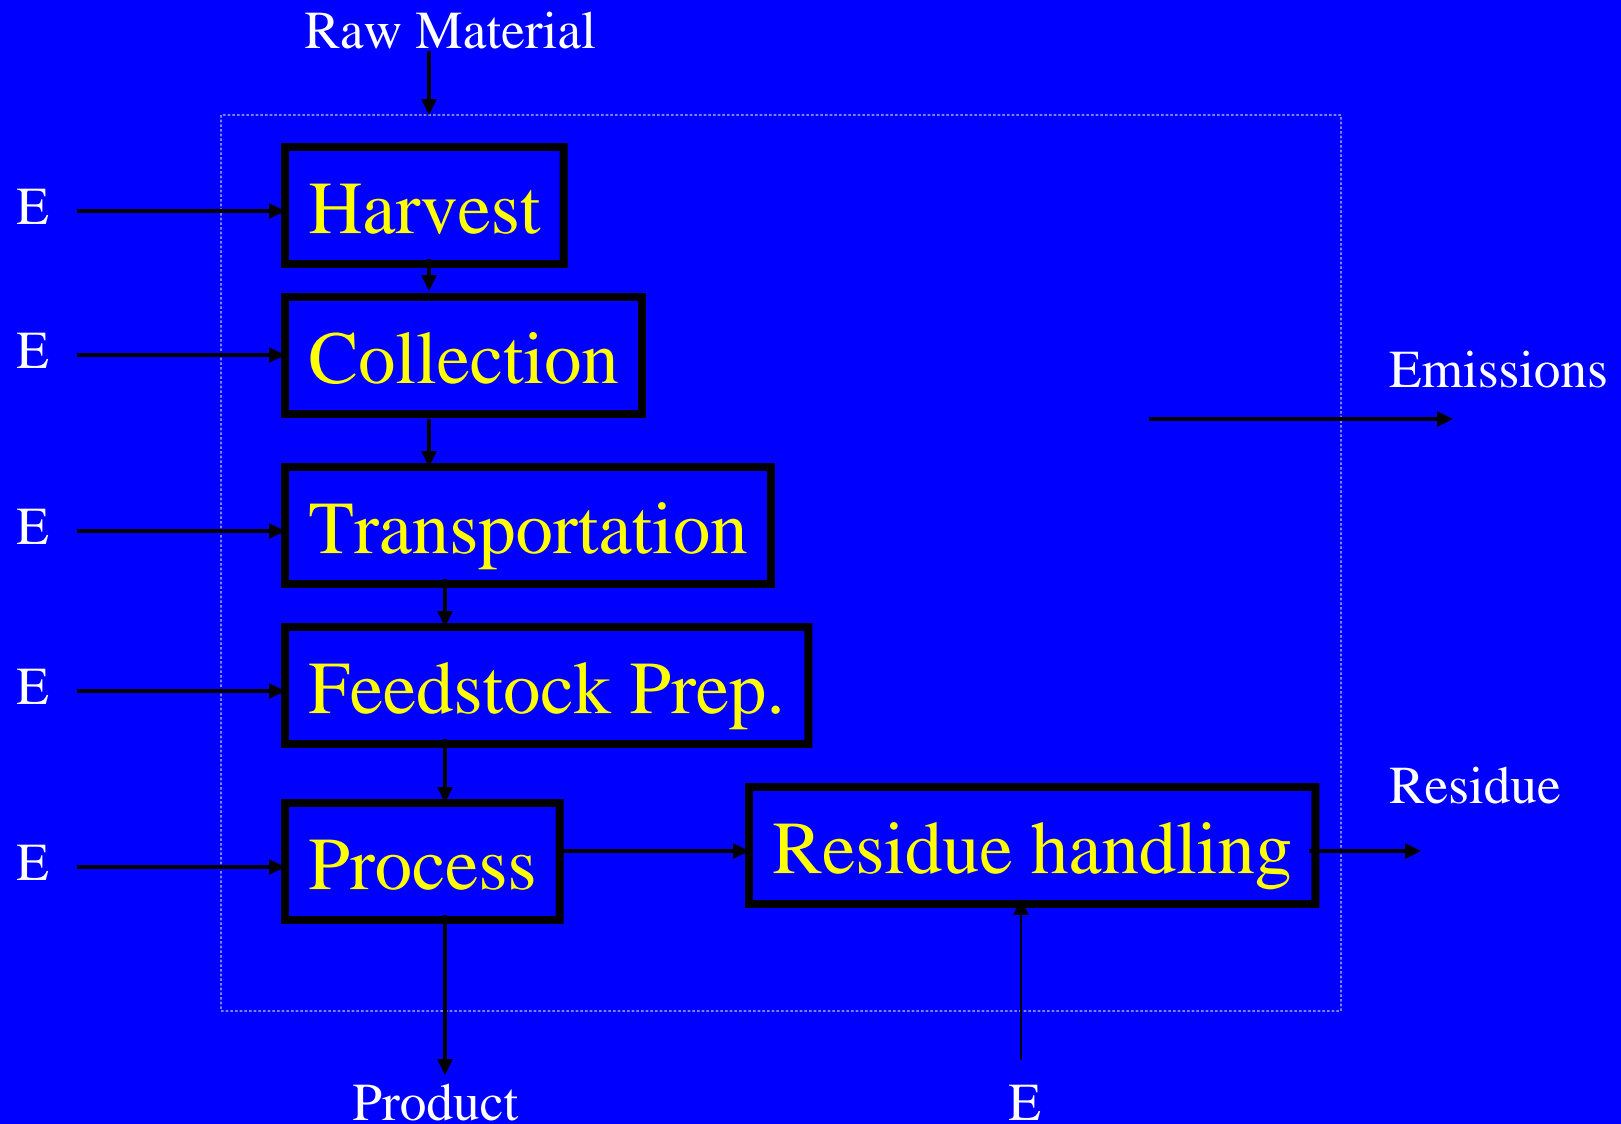

- Pyrolysis
- Gasification

Heat  
Electricity  
Bio-diesel  
Alcohol  
Other organic chemicals

# So What's the Problem?

- Resource Availability
- Processing Cost
  - Harvesting, raw material prep, manufacturing
- Product Quality

# Life Cycle Inventory Analysis

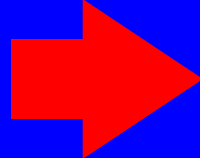

# Combustion of Woody Biomass to produce heat and/or power

*Small scale – units are available for space  
or process heat. Combined heat and  
power may be feasible*

*Large scale – California has biomass  
power plants that consume large quantities  
of woody biomass*

# Combustion

Fuel + Air 

CO<sub>2</sub> + H<sub>2</sub>O + O<sub>2</sub> + N<sub>2</sub>  
+ Ash  
+ Heat  
+ Pollutants

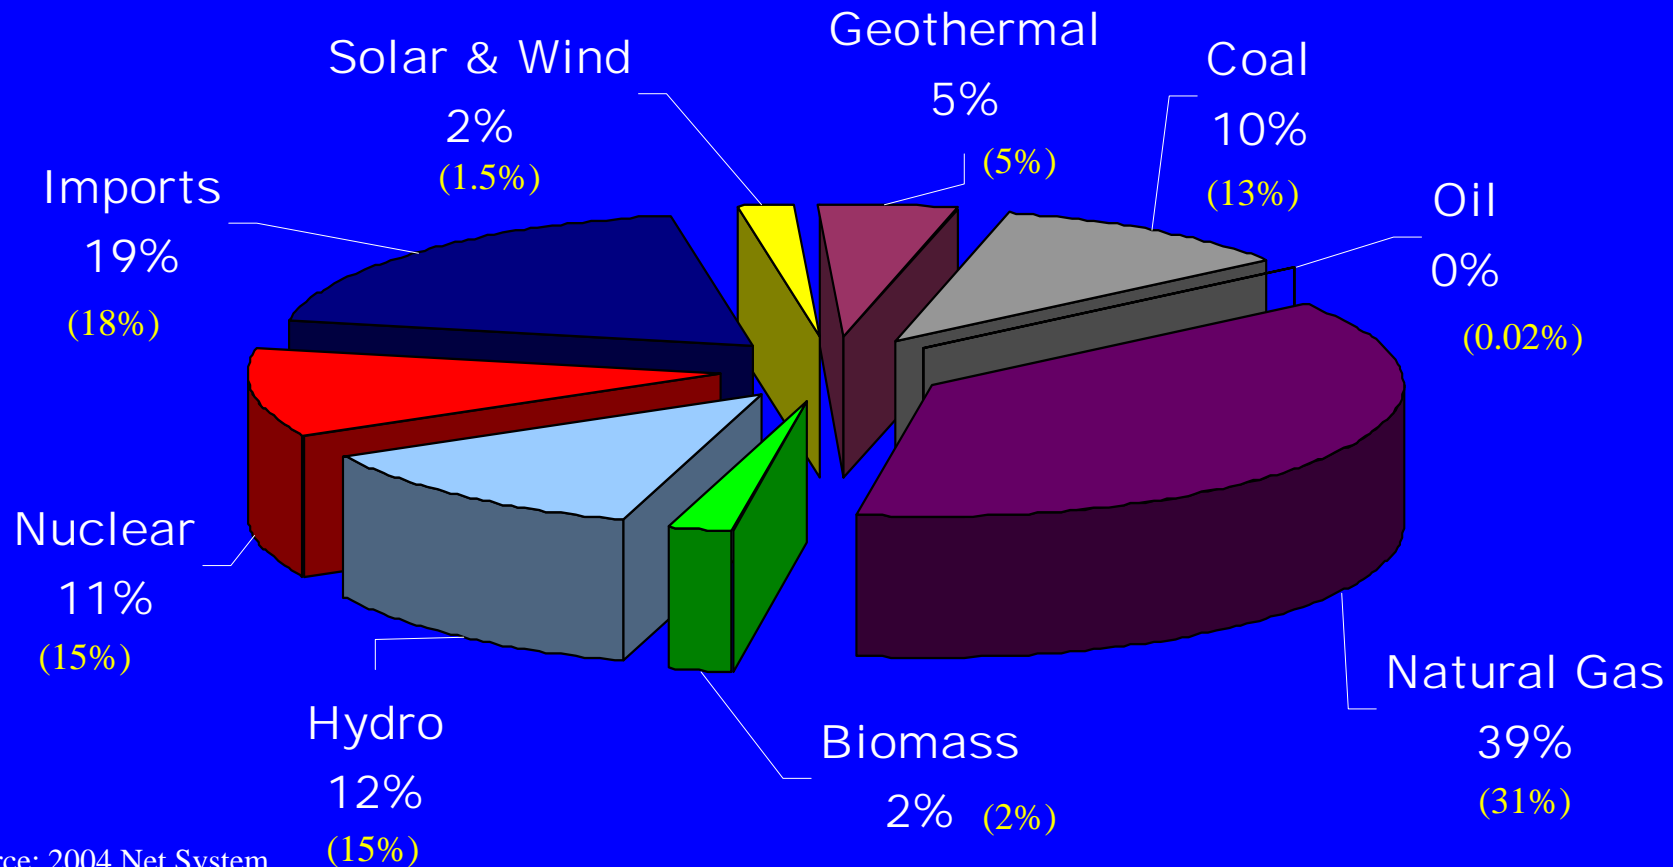

Residential Pellet Stove ????

# 2004 CA Electricity Production

Source: 2004 Net System  
Power Calculation Report,  
CEC-300-2005-004, CA  
Energy Commission

**Total Production: 275,091 GWh**  
**Biomass: 5,997 GWh**

(values in parenthesis  
are for year 1999)

# California Biomass Energy Facilities

A 10 MW (megawatt) generator can supply electricity to about 10,000 homes.

Total capacity of about 626 MW using 4.5 million bone dry tons of biomass per year

- 22% forest base
- 29 % manuf. residue
- 28% Urban woody
- 21% Ag residue

Using less than 10% of total biomass available and about 20% of forest based biomass available

# Typical CA Biomass Powerplant

- 20 MW plant produces about 130 GW/yr
- New plant construction cost = \$65 million +
- Processes 140 - 200 thousand tons/yr  
(1BDT/MW/hour)
- Biomass transported up to 50 miles
- Delivered Biomass valued at \$15 - 25 per ton
- Average production cost ~ \$0.05 - \$0.07/kWh

# California Statewide Resource Supply Curve

# The Future of Biomass Power Plants Depends on ...

- Biomass utilization policies
- Relative price of natural gas and electricity
- Environmental issues
  - Emissions – particulates, CO<sub>2</sub>
  - Carbon Accounting -- does biomass CO<sub>2</sub> have a zero emission impact?
- Societal value placed on biomass disposal/use (e.g. reducing wildfire hazards)

# Problems in Biomass and Waste Combustion

- Inorganic (ash) transformations lead to fouling of fireside surfaces in furnaces and boilers
- Fouling rate depends on composition and concentration of ash in fuel
- Slag formation on grates/Agglomeration in Fluid Beds
- Increased corrosion/acid gas and potential toxics emissions
- Increased maintenance, reduced capacity, reduced efficiency, reduced availability

Alkali + silica  
+ sulfur  
+chlorine  
+ organics

Complex Alkali-silicates,  
sulfates, chlorides,  
carbonates

# Environmental Impact

Air Emissions	Open Field Burning	Biomass Fueled Boiler	Natural Gas Boiler
	lb/Million Btu		
CO	6.89	2.267	0.058
CO <sub>2</sub> fossil		0	114.6
CO <sub>2</sub> non fossil	100 - 350	350.0	0
NO <sub>x</sub>	0.36	0.250	0.301
SO <sub>x</sub>	0.03	0.013	0.073
VOC	0.74	0	0.009
Methane		0	0.003
Particulates	0.66	0.028	0.009

## Emissions by type of Combustion in pounds emitted per ton of Woody Biomass consumed

	PM- 2.5	NO <sub>x</sub>	CO	VOC	N <sub>2</sub> O
Industrial (dry fuel)	0.7 – 6.5	8.8	10.8	0.31	0.23
Industrial (wet fuel)	0.4 – 5.0				
Residential Stove	6 - 23	45 – 100	2 – 14		
Prescribed Burn	12 - 34	3	300	19.0	0.46
Wildfire	17	4.0	140	12 - 24	0.46

## Competing Cellulosic Feedstocks

	Cellulose	Hemi-Cellulose	Energy Content (BTU/lb)	Yield (tons/acre)	Bulk Den. (kg/m <sup>3</sup> )	Million BTU/m <sup>3</sup>	Conversion ratio
Switch-grass	45%	45%	7,000	20	108	1.7	
Miscanthus	45	24	7,700	60	80	1.4	5
Corn Stover	35	25	7,300				< 1
Bagasse	40	22	7,500		60	1	
Wood	42	25	8,000	10	450	8	2 – 5
Coal			10,000		800	17.6	

transportation costs and energy conversion ratio are impt.

# Pyrolysis Process

Biomass plus heat      →      Tars, liquid hydrocarbons,  
    (about 500 C)                      bio-oil, bio-crude  
    (limited or no Oxygen)

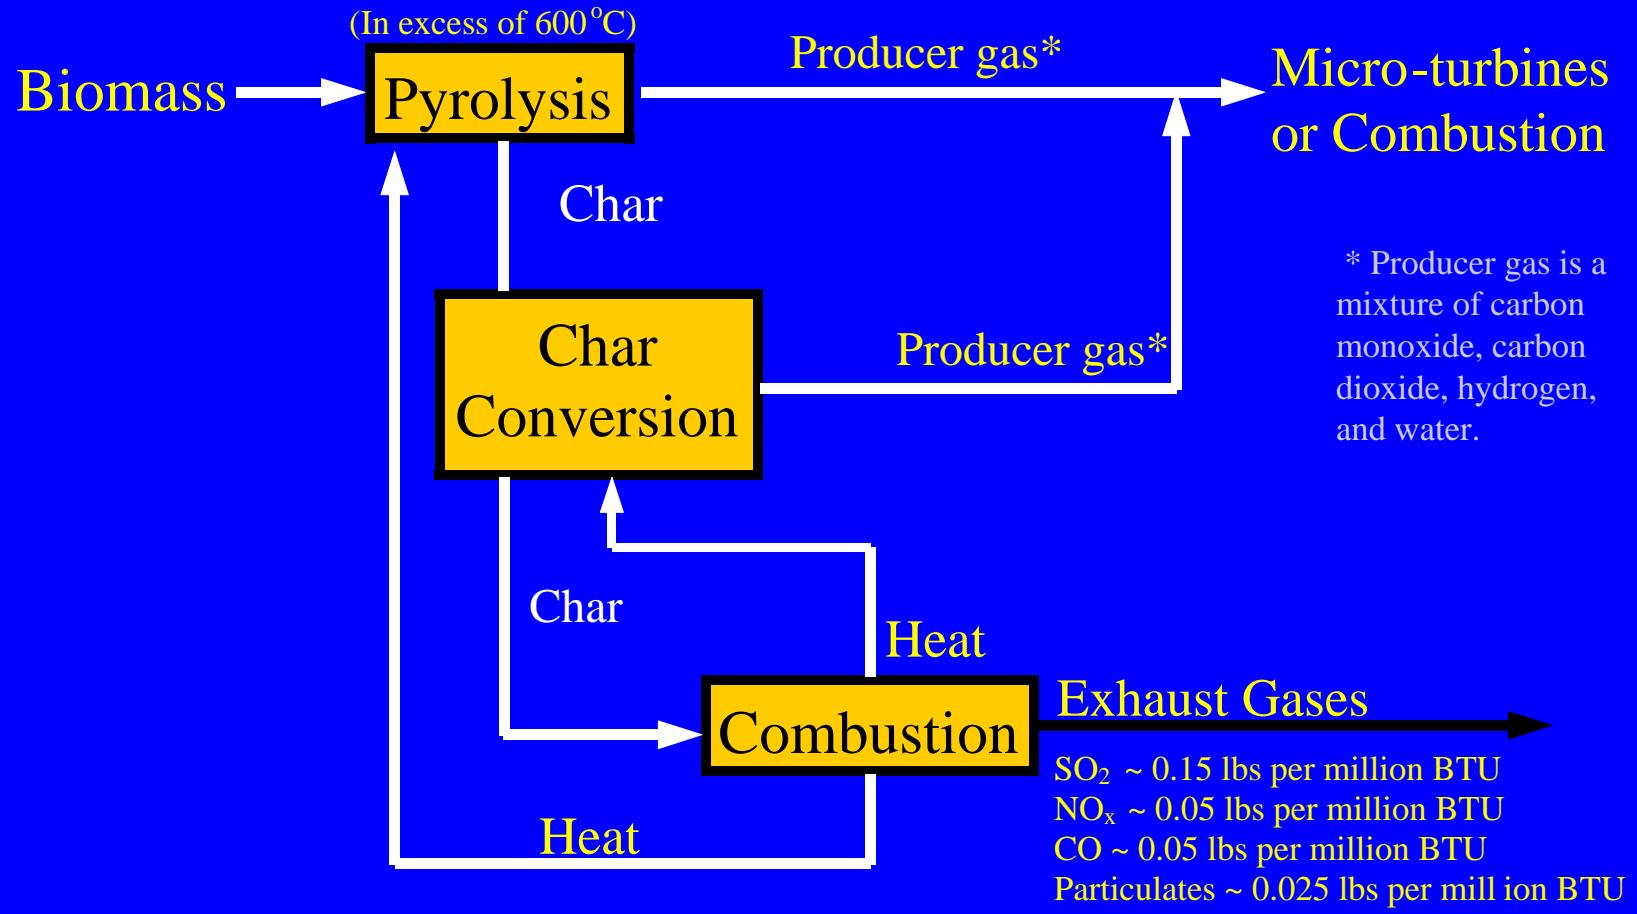

↓  
Char

---

Changing process parameters leads to different products

*...Fast pyrolysis, Advanced Pyrolysis, Torrefication*

# Gasification Process

# Biomass to ETOH Technologies

- Hydrolysis/Fermentation
  - Concentrated Sulfuric Acid
  - Dilute Sulfuric Acid
  - Dilute Nitric Acid
  - Enzymatic
- Thermal Reduction/Chemical Conversion
  - Gasification/Catalytic Conversion (Fischer-Tropsch)

# Hydrolysis/Fermentation

- Dilute nitric acid hydrolysis
  - Separates the 5 and 6 carbon sugars from the lignin
- Yeast Fermentation
  - Converts sugars to alcohol

# Woody Biomass-to-Ethanol

Woody  
Biomass

G = Glucose (a type of sugar)

S = Other sugars

E = Ethanol

# Woody Biomass-to-Ethanol

## Hydrolysis

G = Glucose (a type of sugar)

S = Other sugars

E = Ethanol

# Woody Biomass-to-Ethanol

G = Glucose (a type of sugar)

S = Other sugars

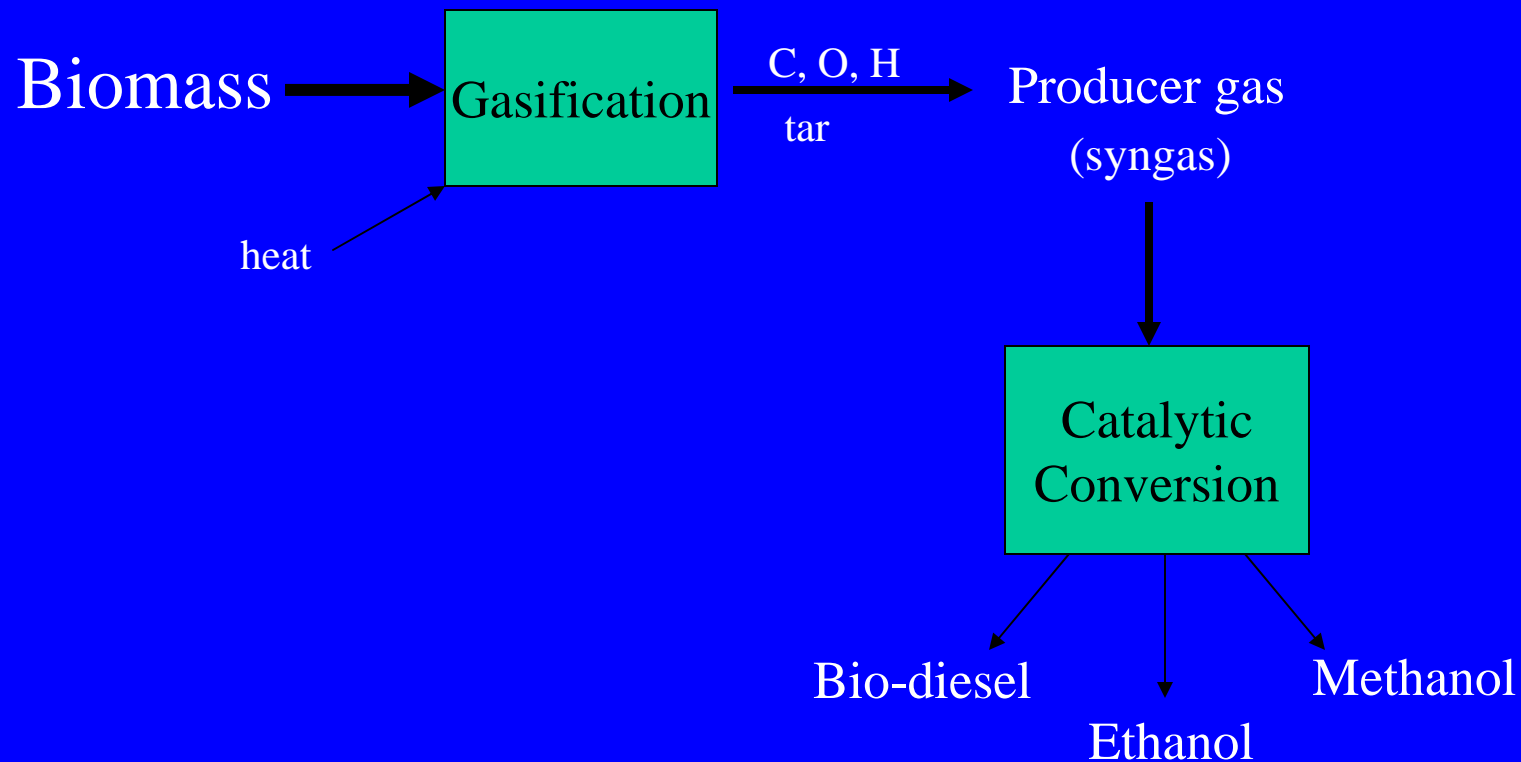

E = Ethanol

# Woody Biomass-to-Ethanol

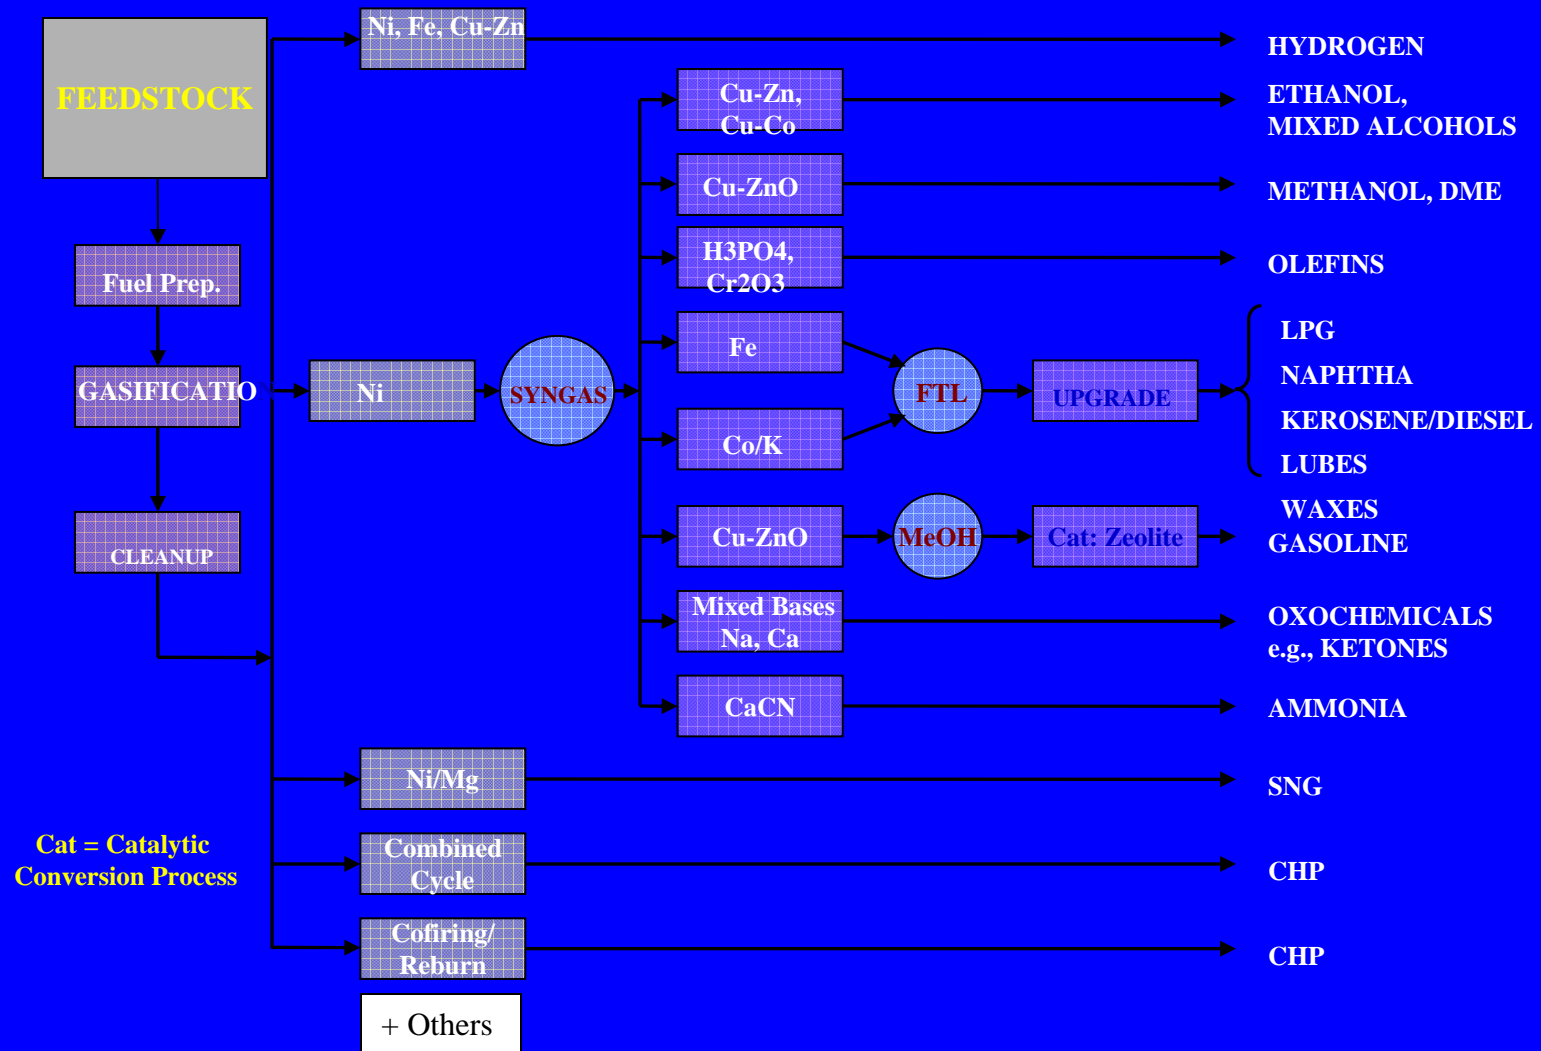

Modified from source slide supplied by USDOE NREL

# Thermal Reduction/Catalytic Conversion

# Thermochemical Processing

## Catalytic Conversion Options

# The Ethanol Issue

- ETOH replaced MTBE as an Oxygenate
- What is the social value of renewable fuels?
- CA demand ~ 600 million gal/year
- What is the best feedstock?
  - Corn
  - Switchgrass
  - Woody Biomass
  - Others?
- Will ETOH be the transportation of the future?

# Challenges for Manufacturing Biomass-Based Products

- Insure a Long-Term Supply of Biomass Raw Material
- Overcome Material Property Limitations (biomass is a low quality raw material)
- Improve Processing Knowledge
- Develop New Markets or Market Share
- Encourage Research Funding and Investment Capital
- Make it Economical -- Reduce the High Handling and Production Costs

# Future Biomass and Small Tree Innovation

1. Reduce handling and processing costs
2. Improve conventional technology
3. Improve conversion efficiency
4. Develop new processes
5. Develop new products
6. Develop new markets
7. Educate public to benefits of utilization

# Summary

- Many woody biomass utilization challenges
  - Raw material quality, economics, markets
- Slim Profit Margins – little room for mistakes
- Small-Scale can't compete in commodity markets
- Biomass Power Plants are important to CA
  - Encourage development in greater energy efficiency
- Demand for renewable fuels continues to grow
- Social value for using biomass can offset high costs of gathering and transporting biomass
- What is the best use?
