

# Control of Sudden Oak Death (*Phytophthora ramorum*) in California

# Why do we care about Sudden Oak Death?

- Over 3 million trees already lost from CA & OR forests
- Ecological effects: forests look and act differently, wildlife impacts
- Social effects: hazard trees, fire dangers, economic costs, emotional impacts
- Ongoing threat: less than 20% of susceptible forest affected so far

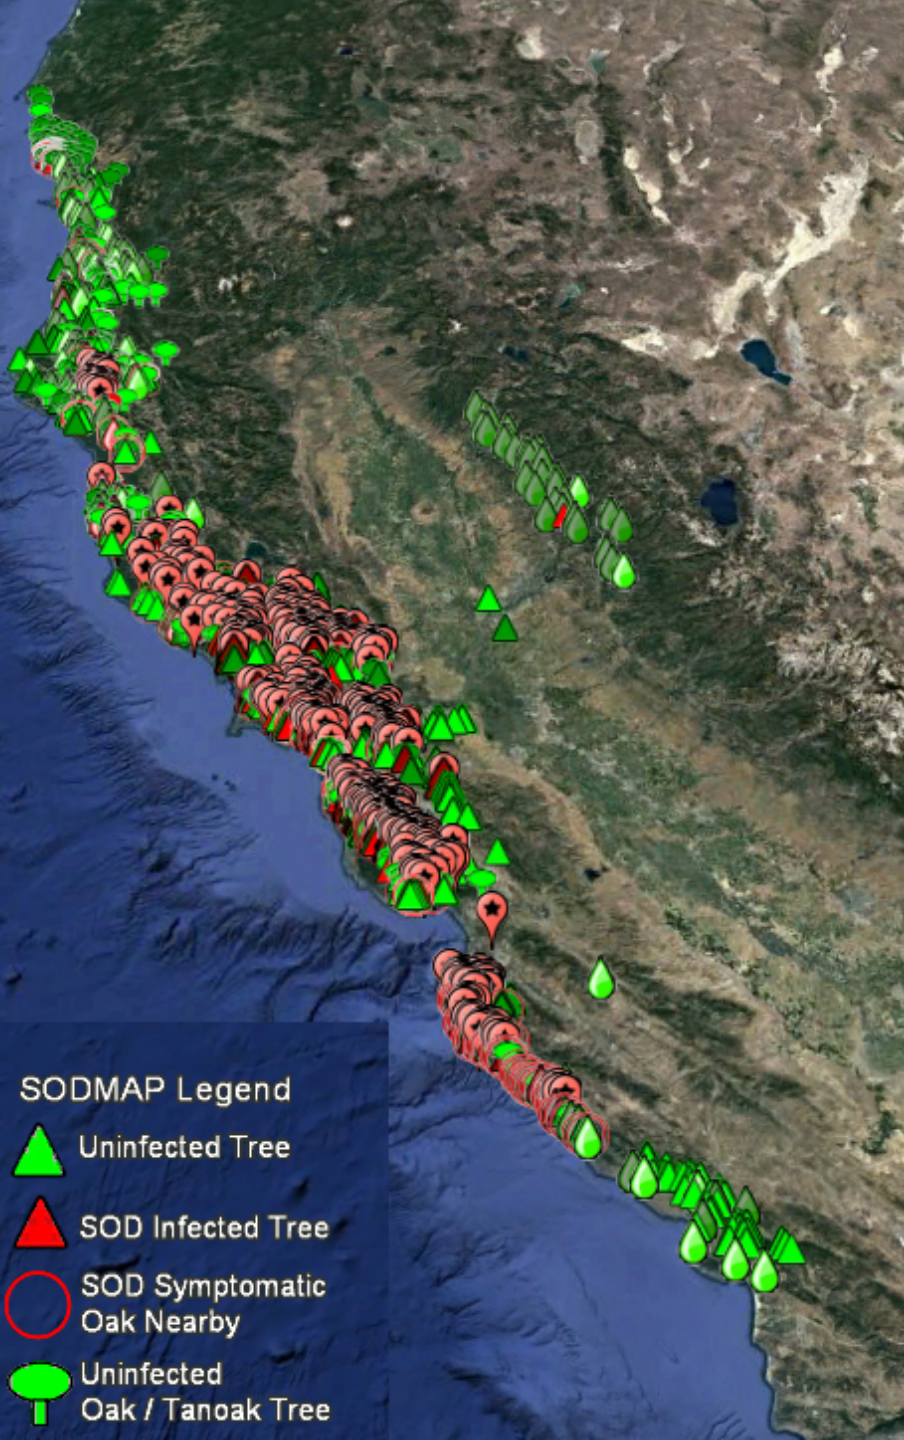

# Outline

  - Hosts
  - Spread
- Management
  - Diagnosis
  - Treatment options

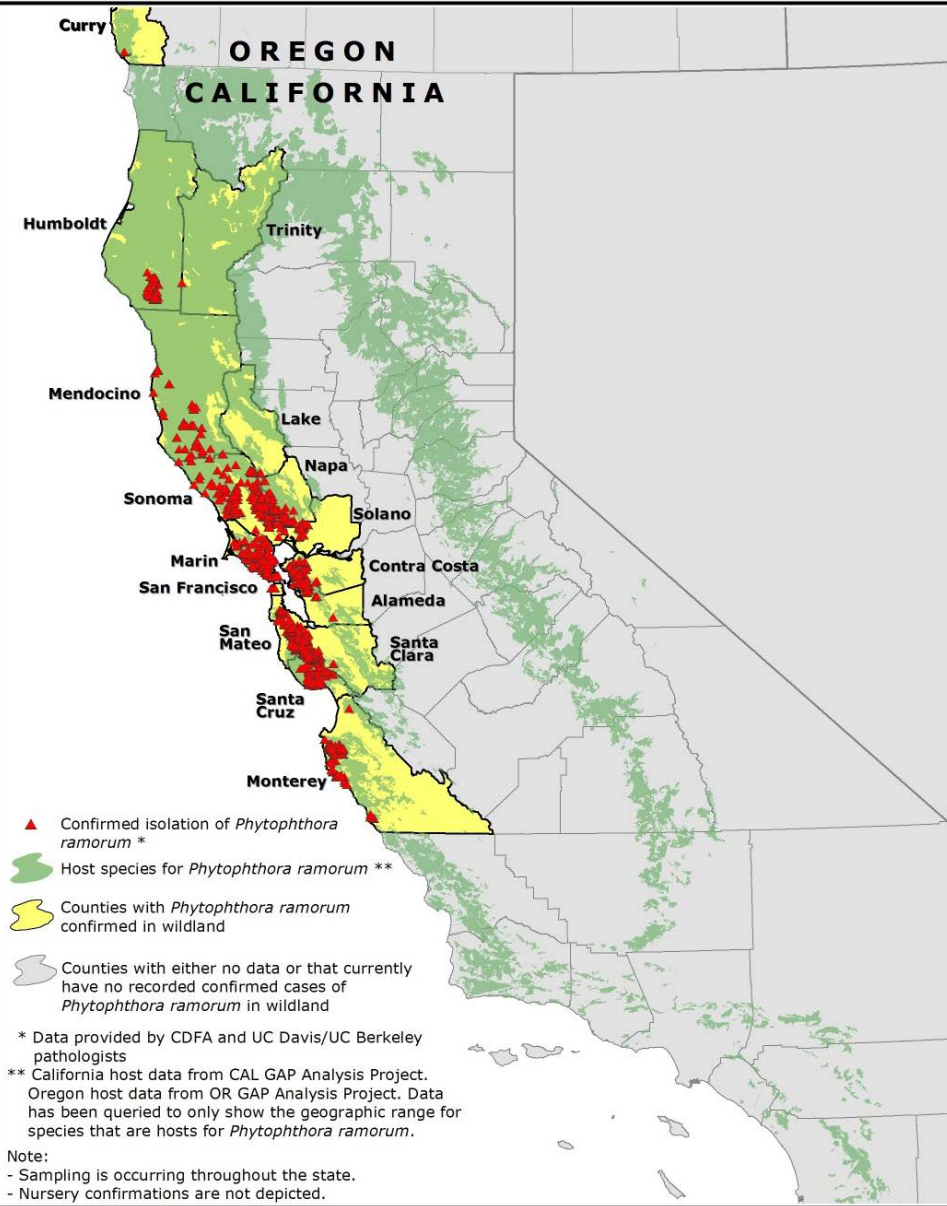

# Distribution of Sudden Oak Death as of July 8, 2014

## SODMAP Legend

-  Uninfected Tree
-  SOD Infected Tree
-  SOD Symptomatic Oak Nearby
-  Uninfected Oak / Tanoak Tree

-  Confirmed isolation of *Phytophthora ramorum* \*
-  Host species for *Phytophthora ramorum* \*\*
-  Counties with *Phytophthora ramorum* confirmed in wildland
-  Counties with either no data or that currently have no recorded confirmed cases of *Phytophthora ramorum* in wildland

\* Data provided by CDFA and UC Davis/UC Berkeley pathologists  
 \*\* California host data from CAL GAP Analysis Project. Oregon host data from OR GAP Analysis Project. Data has been queried to only show the geographic range for species that are hosts for *Phytophthora ramorum*.

Note:  
 - Sampling is occurring throughout the state.  
 - Nursery confirmations are not depicted.

# Symptoms on *Quercus* species

**Canyon live oak**  
(*Quercus chrysolepis*)

# Symptoms on Tanoak

(*Notholithocarpus densiflorus*)

# Symptoms on foliar hosts

- Infections limited to leaves and twigs; *not fatal*

# Spread from foliar hosts

- Ideal conditions:
  - 61-72° F
  - Wet for 12+ hours
- Outbreaks occur when ideal conditions occur for 2+ consecutive years

# Spread through recreation

# Spread through nurseries

# *P. ramorum* look-alikes

## Other *Phytophthoras*

*P. nemorosa*

*P. pseudosyringae*

## Other diseases & injuries

Bacterial wetwood

*Armillaria* and bark beetles

Insect borers

Canker fungi

Root diseases

## Abiotic problems

# Leaf sampling

- For each foliar host
  - Collect 5-10 symptomatic leaves for each tree
  - Place in ziplock bag
    - Write date, location & contact information on bag
  - Submit promptly
    - Monday through Wednesday
- For bark samples
  - Contact trained sampler

# Treatment options: **dis/unproven**

- **Insecticides:** do not address underlying *P. ramorum* infections.
- **“Alternative” treatments:** soil amendments, fertilization, compost teas, etc. do not appear to be effective against the pathogen.
- **Excisions:** no effect

# Chemical treatment

- Phosphonate
  - Injection
  - Surface application
- Application
  - Specimen trees
  - Every year in the fall (2x the first year)
  - Prophylactic, not curative!

## Arborists and Applicators

We provide a list of tree care professionals who have been through a COMTF training session on symptom recognition/sampling and the use of the Agri-fos/Pentra-bark treatment **in the past three years**, and have given their names and contact information for this referral list. These persons have been trained to recognize *Phytophthora ramorum* in the field, and have been informed of the process for collecting and sending samples for analysis with the California Department of Food & Agriculture. **Note:** This list should be viewed as a resource only, and is not an endorsement by the Task Force of any specific company or service.

You can access the [Trained Professionals List](#) as a PDF or download the original [trained professionals spreadsheet](#) to more easily sort for professionals in your area. Please note that while a person may be listed in a particular county, most professionals work much further afield than that. If you are unable to find someone in your immediate area, try contacts in the neighboring counties as well.

### For Professionals

If you are a professional who needs to update contact information, please use our [online form](#) to submit your information. Once we have your complete and current contact information, we will update the online list.

If you are a professional who would like to be added to our list, you can find our schedule of workshops and trainings on the [Calendar of Events](#). If our current list of training options does not meet your needs, please fill out a [Workshop Request](#) so we can better plan our workshop schedule.

# Cultural treatments

(i.e., foliar host removal & pruning)

- Not for use in a pure tanoak stand
- May be used alone or with phosphonate
- Use caution: may result in no mature trees

## Prescriptions

- 2.5 – 5 m of clearance
- Storm wind direction
- Focus on lower branches
- Monitor for sprouts & remove

# Disposal

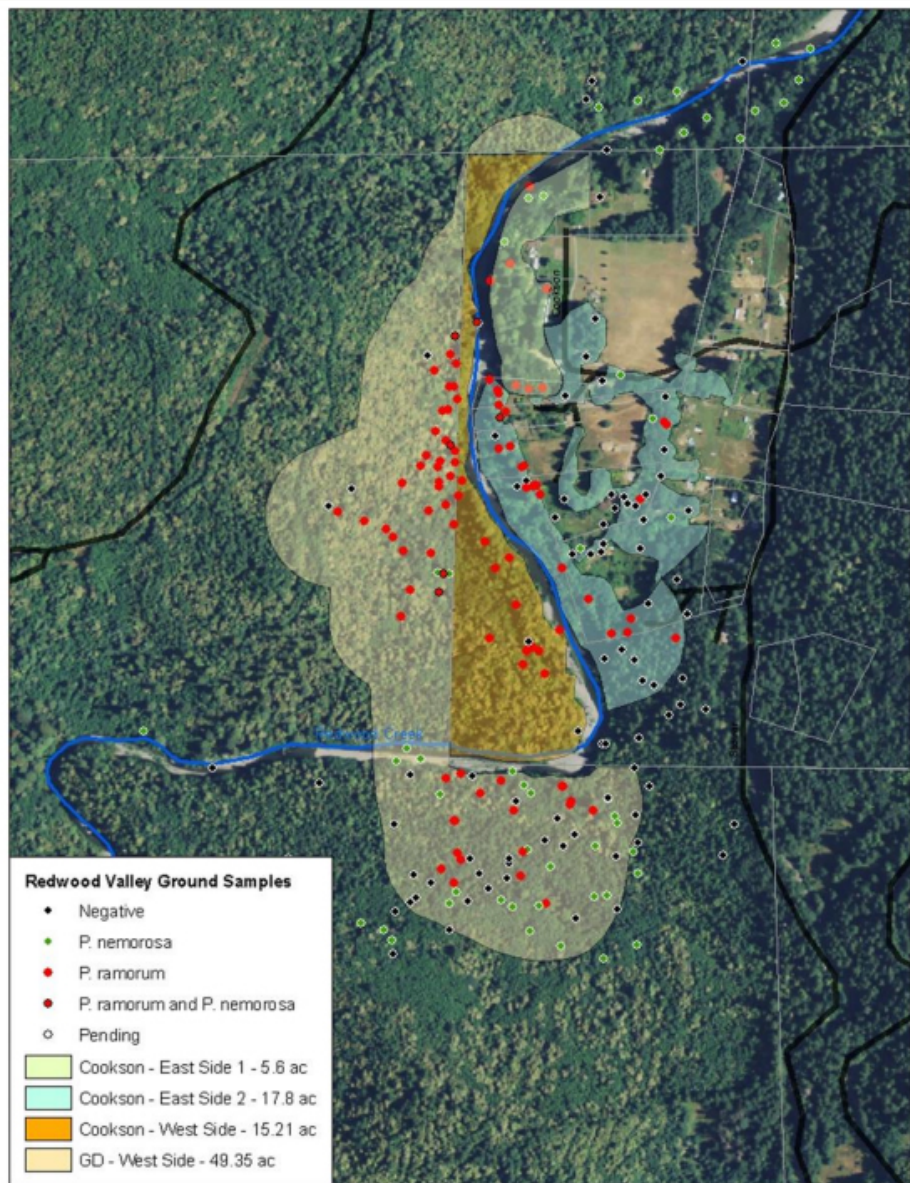

- Leave dead trees standing if no hazard
- Best left on site
  - Wrap cut wood in clear plastic if infested with insects
- Commercial landfills & composting yards
- Don't move material out of county

The VAN DUZEN NO-HOST ZONE (¼ mile wide, 2 miles long)

# Prevention is key!

## STOP THE SPREAD OF SUDDEN OAK DEATH

Plants in this area are infected with the pathogen, *Phytophthora ramorum*, that causes Sudden Oak Death or Oak Mortality Syndrome. This deadly fungus-like organism kills tanoak, coast live oak, black oak, and Shreve's oak in California's coastal counties. It also infects many other trees and shrubs in this area, including California bay, madrone, and douglas-fir.

Please help prevent the spread of this serious plant pathogen by observing the following precautions:

### WHILE HERE...

Park your vehicle only in designated parking areas.  
Stay ONLY on established trails - DO NOT hike off trail.  
DO NOT collect ANY plant material (leaves, twigs, wood).  
DO NOT collect soil and avoid muddy areas.  
Clean off shoes/boots before departing.

### BEFORE GOING TO UNINFECTED AREAS...

Clean soil and mud off of shoes.  
Wash mud or soil off of tires, wheel wells and undercarriage of your vehicle at nearest automated car wash (930 E. Cotati Ave.).

For further information visit [www.suddenoakdeath.org](http://www.suddenoakdeath.org) or call 707/795-5069.

These guidelines provided by the California Oak Mortality Task Force are based on the best current knowledge and may change as new information becomes available.

## What is Sudden Oak Death?

Sudden Oak Death is a tree disease caused by the plant pathogen *Phytophthora ramorum*. The disease kills some oak species and has had devastating effects on forests in California and Oregon. [Read more about Sudden Oak Death.](#)
