

Landscaping Tips to Help Defend Your Home from Wildfire

PAMELA M. GEISEL, Academic Coordinator, UC Statewide Master Gardener Program;
DONNA C. SEAVER, Program Representative, UC Statewide Master Gardener Program.

You can have both a beautiful landscape and a defensible fire-safe zone around your home. A minimum defensible space of 100 feet around your home is required by California law (Public Resources Code 4291). This space consists of a 30-foot Lean, Clean, and Green zone and a 70-foot reduced fuel zone. The goal is to protect your home while providing a safe area for firefighters. Local terrain and wind patterns may make it prudent to have an even larger zone. Check with your local fire department for defensible space requirements in your area. Current regulations also allow an insurance company to require additional clearance.

The accompanying three-panel poster provides useful guidelines for people who are establishing or maintaining defensible space around their homes. We recommend using the following publications as support documents for the poster:

- **Home Landscaping for Fire**— ANR Publication 8228. This publication discusses how and where to plant and maintain vegetation, including hydrozoning, use of hardscape, and annual maintenance.
<http://anrcatalog.ucdavis.edu/pdf/8228.pdf>
- **Homeowners Check List—How to Make Your Home Fire Safe**— California Department of Forestry and Fire Protection (CAL FIRE)
http://www.fire.ca.gov/about_content/downloads/CDFchecklist2006.pdf
- **Why 100 Feet?—Protect Your Home...and Property**— California Department of Forestry and Fire Protection (CAL FIRE)
http://www.fire.ca.gov/about_content/downloads/CDFWHY100FEETBROCH2006.pdf
- **100' Defensible Space: Make Your Home Fire Safe**
http://www.fire.ca.gov/about_content/downloads/Defens_space_flyer4_11final.pdf

**ADDITIONAL INFORMATION
ON SPECIFIC POINTS IN THE POSTER**

Fire Resistant Plants (from *Home Landscaping for Fire*). It is important to remember that, given certain conditions, all plants burn regardless of how they are classified. In general, select plants that are low growing, open structured, and less resinous. However, how your plants are maintained and where they are placed is as important as the species of plants that you choose. Cultural practices and landscape management (e.g., pruning, irrigation, and cleanup) have a greater impact on whether or not a plant ignites than does the species. When choosing plants for a fire safe landscape, select those with the following characteristics:

- High moisture content in leaves
- Little or no seasonal accumulation of dead vegetation
- Open branching habits
- Fewer total branches and leaves
- Slow growing, so less pruning is required
- Nonresinous material on the plant (i.e., stems, leaves, or needles that are not resinous, oily, or waxy). Junipers, pines, spruces, and firs are resinous and highly flammable.
- Examples: yarrow, candytuft, rock rose, creeping rosemary, goldmoss sedum

Defensible Space Landscaping in the Urban/Wildland Interface: A Compilation of Fire Performance Ratings of Residential Landscape Plants. This is a UC “work in progress” online publication (<http://nature.berkeley.edu/~fbeall/HODefSpaceGuide.pdf>) that provides more detail about fire resistant plants.

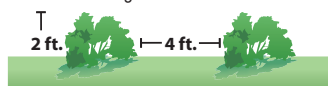

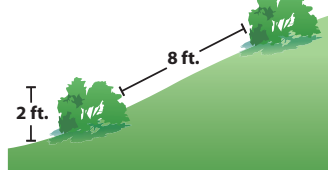

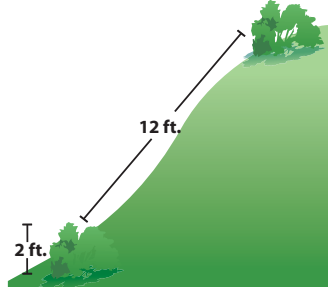

Fire Resistant Plant Information Specific to El Dorado County Areas. Look under the *Fire—Wildland/Urban Interface* heading at http://ceeldorado.ucdavis.edu/Natural_Resources/NR_Publications.htm

Reduced Fuel Zones Greater than 100 Feet (from *Home Landscaping for Fire*) The reduced fuel zone is an area adjacent to the 30-foot Lean, Clean, and Green zone. It extends out *at least* an additional 70 feet away from the house (for a total of 100 feet), where the ground slope around the house is less than 10 percent.

To determine the additional distance required for slopes of more than 10 percent, multiply the number of degrees over 10 percent for the uphill and sides by 3 and add it to 100. On the downhill side, multiply the number of degrees over 10 percent by 5 and add it to 100. Your local fire department or your insurance company may ask that you prepare a larger defensible area. Contact them for requirements in your area.

Trees. For slopes that are less than 20 percent, trim or space existing trees so that there is 10 feet of space between the tips of their limbs. Increase the space to 20 feet for slopes that are 20 to 40 percent. For steep slopes over 40 percent, 30 feet of spacing is needed. When planting trees, allow for future growth by spacing them 20 to 30 feet apart. If trees are over 18 feet tall, prune the lower limbs up to a height of 6 to 15 feet. In order to avoid stress to the tree, no more than one-third of a tree’s live limbs should be removed by pruning. Remove all shrubs from around the base of trees.

Shrubs. To reduce the fire-spreading potential of shrubs, only plant varieties that are widely separated, low growing, deciduous, and nonresinous. These can be planted individually or in small clumps. The spacing between plants depends on the slope of the property. The rule of thumb for spacing is illustrated below (illustrations courtesy California Department of Forestry and Fire Protection [CAL FIRE]).

Slope	Spacing
0 to 20%	2 times the height of the shrub 
20 to 40%	4 times the height of the shrub 
Greater than 40%	6 times the height of the shrub

Landscaping Tips to Help Defend Your Home from Wildfire

Through proper planning, you can have both a beautiful landscape and a fire safe zone around your home.

Begin by creating and maintaining a *Defensible Space* of 100 feet around your home that includes:

- A **Lean, Clean, and Green Zone** of 30 feet, **plus**
- A **Reduced Fuel Zone** of 70 feet

Note: Even greater defense zone widths are necessary when your home is on a steep slope or in a windswept area.

Please contact your local master gardener for more information <http://camastergardeners.ucdavis.edu>

October 2007 MG_07.2.1

Create a Defensible Space of 100 Feet Around Your Home

First, create a Lean, Clean, and Green Zone

by removing all flammable vegetation and combustible materials within 30 feet immediately surrounding your home.

- Keep trees trimmed at least 10 feet from chimneys and remove dead branches hanging over structures.
- Remove build-up of needles and leaves from roof and gutters.
- Remove dead and dying plants, fallen leaves, needles, twigs, bark, cones, pods, small branches, etc.
- Regular maintenance (pruning, weed control, adequate irrigation) is necessary to maintain the fire resistance of your landscape.
- Increase spacing between plants.
- Landscape with fire resistant plants – low growing, open structured, and less resinous.
- When clearing vegetation use care in operating equipment such as lawnmowers.

Create a Defensible Space of 100 Feet Around Your Home

Next, create a *Reduced Fuel Zone*

adjacent to your *home defense zone*, extending out at least an additional 70 feet, or to your property line. Greater defense zone widths are necessary when your home is on a steep slope or in a windswept area.

Open space between plants improves the chance of stopping a wildfire. You have two options:

- a) Create horizontal and vertical spacing between plants. The amount of space will depend on how steep the slope is and the size of the plants.

- b) Large trees do not have to be cut and removed, but plants growing beneath them that are greater than 4 inches in height should be removed. Remove lower limbs of trees to at least 6 feet, up to 15 feet (or the lower 1/3 of branches on smaller trees).
